Should your
GEAR DEPARTMENT
be in Richmond, Indiana?

Today, that's a better question than ever. The current completion of 65% additional square feet of production capacity further improves our position to serve as your gear department.

Many of our best customers use us in this manner with all of our facilities geared to their gear needs. Would you like to learn how successful these associations have been, and what a similar service might mean in terms of reduced costs and better gears?

If so, write. The man who responds to your inquiry will be a gear engineer.

EATON

AUTOMOTIVE GEAR DIVISION
MANUFACTURING COMPANY
RICHMOND, INDIANA

GEARS FOR AUTOMOTIVE, FARM EQUIPMENT AND GENERAL INDUSTRIAL APPLICATIONS
GEAR-MAKERS TO LEADING MANUFACTURERS

Its Job is to Help Produce Power

As the public utilities race to keep up with demands for more and more power, forgings like this become increasingly important. The one you see here is a steam-turbine spindle, and it will soon be doing its part in the large-scale production of kilowatts.

Bethlehem press-forged the spindle from an alloy-steel ingot containing molybdenum, chromium, nickel, and vanadium. Then the Bethlehem machine shops took over and worked carefully to exacting

specifications. When ready for shipment, the spindle weighed 28 tons; was 18 ft 6 in. long.

This is just one of the many types of forgings that Bethlehem makes each year. Our shops are equipped to produce the largest, the smallest, and everything in between. Whether you need tiny drop forgings or huge shafts weighing a hundred tons, we can make and machine them for you. Call us and draw upon our half-century of experience.

BETHLEHEM STEEL COMPANY, BETHLEHEM, PA. On the Pacific Coast Bethlehem products are sold by Bethlehem Pacific Coast Steel Corporation, Export Distributor: Bethlehem Steel Export Corporation

BETHLEHEM STEEL

Take a new look at ZIRCONIUM

Now zirconium takes another giant step ... from an expensive rarity to a readily available special-purpose metal. Capacity is now on hand for not only A.E.C. requirements but also commercial markets. And, as in titanium, Mallory-Sharon is in the forefront of this rapid development.

A modern, highly efficient zirconium and titanium sponge plant at Ashtabula, Ohio, now makes Mallory-Sharon the largest single source of metallic zirconium, and its by-product, hafnium.

Mallory-Sharon's integrated production facilities ... from raw materials through finished mill products ... mean *greater availability* and *lower costs*.

We're ready *now* to help you explore practical commercial uses for zirconium. Write us for technical information, or engineering assistance on specific applications.

For availability — As Mallory-Sharon's large, modern, sponge plant reaches full production this year, zirconium becomes readily available for all commercial applications.

For lower prices — Greater availability will definitely be reflected in lower prices. In many cases, the improved performance of zirconium parts much more than offsets their higher material cost.

For technical facts — Write for new 16-page booklet, giving technical and application data on zirconium ... its excellent corrosion resistance to most acids, alkalies and combinations of these media ... its remarkable nuclear properties.

For mill products — Zirconium is now available from Mallory-Sharon in the form of rounds, bars and

billets, wire, tubing, strip, foil, sheet and plate. Quality and properties are carefully controlled at every stage of production.

Small-lot production of step shafts more than triples

*...when Warner & Swasey No. 3
Electro-Cycle[®] with Versatile
Step Turner, Handles the Job at
Hobart Brothers Co., Troy, Ohio*

On this versatile Step Turner attachment—once the initial cutter setting has been established—two to four different diameters can be easily selected by simply turning the micrometer dials to desired diameters. If needed, a fifth diameter may be obtained by using the stop screw located at the lower rack's end. Step Turners are available with diameter capacities $\frac{3}{8}$ " to $1\frac{1}{2}$ ", shoulder lengths variable as required, with a total length limitation of 10 inches.

Also, their Electro-Cycle's flexibility and ease of job changeover permit the handling of a wide variety of less complex work in lots of 5 to 50 pieces. As many as 17 jobs have been completed during a 9-hour shift!

Hobart Brothers Co., one of the world's largest manufacturers of electric arc welding equipment, relies on their new Electro-Cycle Turret Lathe to machine a majority of the smaller turned components in their motor generator sets.

The Electro-Cycle's Step Turner attachment enables the automatic turning of five separate diameters in a single setup. The part being machined is completed by using only five stations on the hexagon turret—end stop, center bar end, center support, step turn and then thread. Necking for grinding and thread relief is easily handled from the square turret.

As all shafts are subsequently ground, Hobart holds their machining tolerances to $+.005$ " $-.000$ ". These tolerances are easily handled by the versatile Step Turner attachment.

An AISI 4140 steel governor shaft was formerly produced at the rate of 2 to 3 pieces hourly—now one is finished each 4 to 5 minutes. As their shafts are produced from standard mill lengths of bar stock, the Electro-Cycle's Power Bar Feed and Collet Chuck have proved to be a great fatigue-saver to the operator.

Contact your nearest Warner & Swasey Field Representative to get the complete story on how Electro-Cycles can radically improve your production—and profit picture, too. He's as near as your telephone, so call today.

® Reg. U. S. Pat. Off.

This Electro-Cycle Turret Lathe, shown operating at Hobart Brothers Co., is used for both long and short run production. Automatic, electrical control of all spindle functions greatly reduces machine handling time. They handle a wide variety of jobs in materials from copper and brass up to the toughest alloy steels used today.

YOU CAN PRODUCE IT BETTER, FASTER, FOR LESS...WITH A WARNER & SWASEY

FIRST with VACUUM DEGASSING in die casting die steel THERMOLD AV

For your most exacting die casting jobs, Thermold AV gives you the assurance of highest quality by the use of the ultimate in melting technique—vacuum degassing.

Now large size ingots are vacuum degassed in standard production processing—the first tool steel degassing installation in the United States.

This new advantage is in addition to quality controls that have set the standard for the industry—small batch furnace melting, close control of press forging and annealing, and 100% Reflectoscope testing.

With this contribution to the high quality of Thermold AV, Universal-Cyclops gives further assurance of homogeneity of structure, freedom from gaseous impurities, high polishing quality and the utmost resistance to thermal and mechanical fatigue.

Write for new bulletin.

A heat of Thermold AV being processed in the vacuum degassing installation.

A block of Thermold AV measuring 18" x 36" x 48". One of the largest forged blocks of high alloy die casting die steel ever produced—typical of sizes available vacuum degassed.

STEEL, the metalworking weekly, is selectively distributed without charge to qualified management personnel with administrative, production, engineering, or purchasing functions in U. S. metalworking plants employing 20 or more. Those unable to qualify, or those wishing home delivered copies, may purchase copies at these rates: U. S. and possessions and Canada, \$10 a year; all other countries, \$20 a year; single copies, 50 cents. Metalworking Yearbook Issue, \$2. Published every Monday and copyright 1958 by The Penton Publishing Co., Penton Bldg., Cleveland 13, Ohio. Accepted as controlled circulation publication at Cleveland, Ohio.

Index available semiannually. STEEL is also indexed by Engineering Index, 29 W. 39th St., New York 18, N. Y.

How to

drive it with **Acme** chain and sprockets

Acme Precision Roller Chains and Sprockets are easily adaptable for most any drive where maximum efficiency is essential, a few of which are illustrated below.

Acme Chains and Sprockets deliver Positive — Efficient — Economical — Flexible — Rugged — and Quiet Power Transmission. For the solution of your power transmission problems, send them to Acme.

Write Dept. 10-D for new illustrated 100 page catalog which includes new engineering section showing 36 methods of chain driving.

behind the scenes

Process Improves with Age

Everybody knows that, until the boys who are juggling atoms can cook up synthetic batches of the metal, iron is one of the expendable treasures of the earth. In theory, when all the iron ore is used up, no more of the stuff will grow. Folks in the iron business are aware of this, and they are making long range plans that take into consideration the state of the ferrous world a century from now.

In the history of the earth, men and iron have been associated no longer than a wink of time, and it is sobering to think that the wink is almost completed. However, the thought that engages our attention is the curious fact that, in the sunset of its siderological progress, iron is again being separated from its ores the same way it was when man first experimented with the metal: By direct reduction, with sponge iron as an immediate result.

True, these terms are used somewhat loosely, but they serve to picture the process. Well, on Page 78 this week, STEEL shows how modern, direct reduction of ore in making sponge iron has opened the door to economical production of steel in many world areas unable to establish steel industries. Iron ore formed about 5 per cent of the earth's crust before a lot of it was used up in wars and industrial expansion, but in the old days (before this article went to press) steelmakers were obliged to resort to blast furnaces, which cost a pretty penny in any currency. Officials of Fierro Esponja S. A., Monterrey, Mex., an affiliate of Hojalata y Lamina S. A., one of Mexico's principal steel producers, invited M. W. Kellogg Co., New York, a subsidiary of Pullman Inc., to huddle with them over the idea of making iron without blast furnaces.

The Kellogg people came through in fine style, and we're glad that they did, because the entire operation makes a fine story for our technical section.

Steel Shoe Shanks

While we're on the subject of iron, it would be consistent to introduce the American Iron & Steel Institute, and permit that learned and metallurgically erudite organization to contribute an addenda. Guided by this charitable thought, we fished through some of its recent press releases, but failed to progress beyond an item on stiletto heels.

"Stiletto heels," said the AISI, "have made many people aware of an old use of steel—its use in shoes. Those high, slender heels on ladies' dress shoes are made practical as well as stylish by cores of steel. The core resembles a fluted nail or spike, rising to a top lift. It is inserted into a plastic heel block under

pressure. The shanks are made from cold rolled steel strip . . ." and with those words we stopped reading, because the phrase popped out of nowhere and possessed us: Steel shoe shanks.

It whirled about madly and tenaciously like the terrible rhyme that nearly drove Mark Twain crazy. Remember? It was about conductors exhorting themselves to punch tickets in the presence of the passenger, and it went like this:

*Punch, brothers, punch,
Punch with care—
Punch in the presence
Of the pass-en-jare—*

Unfortunately, "steel shoe shanks" was almost as enervating as "punch, brothers, punch." The only way to get rid of it was to make it into a rhyme, and pass it on:

*Walk, baby, walk
On steel shoe shanks.
Walk without clinking,
But just dig them clanks!*

Silver Moon Can't Rust

In the area of constructive knowledge we feel urged to quote from the Rust-Oleum Corp., an organization which recently developed a Rust Index of the United States. (STEEL, Sept. 1, p. 37.) Evanston, Ill., rust fighting company unveils a big geographical variance in the country's corrosion rate. Depending where in the U. S. it was exposed, a panel about the size and weight of an auto license plate would rust in three to 15 years. For instance, it would rust quicker in Boston than in Yuma, Ariz. But on the moon, says Rust-Oleum brightly, it wouldn't rust at all. That is because the moon has no moisture, no free oxygen. So, if you ever drive the moon, you need never worry about your license plates growing rusty.

Name the Cards

Here are four playing cards. The jack is nearer to the queen than the king is to the jack. The jack is nearer to the queen than the queen is to the jack. The spade is nearer to the club than the diamond is to the spade. The spade is nearer to the heart than the club is to the spade. The heart is just to the left of the king. Name all four cards.

Shred

Birdseye view of the future...

Youngstown's Expansion

**Program provides more
quality steel for
Mid-America**

The hustle, the feel of the future and the booming spirit of expansion . . . this is the spirit of Youngstown. The birdseye view shows our Indiana Harbor facilities where we are putting this spirit to work in the Chicago area. In addition to our No. 2 Blooming Mill (2), No. 2 Open Hearth Shop (3), Merchant Mill (4), No. 1 Open Hearth Shop (5), Billet and Skelp Mill (6), Continuous Weld Pipe Mills (7), Blast Furnaces (8), Coke Plant (10), Strip and No. 1 Tin Mills (11), the Cold Reduced Sheet Mill (12) . . . our new No. 3 Seamless Tube Mill (1), our new (9) Sintering Plant (construction began in March 1958) and our new No. 2 Tin Mill (13) are shown. These last three expansions are pointed directly at the growing markets of the Mid-Continent. Like the pioneers who made America the great nation it is, Youngstown moves toward new horizons . . . new ways to supply your steel needs through quality products and friendly, efficient service!

PLANTS AT YOUNGSTOWN, OHIO AND INDIANA HARBOR, INDIANA

Centrifugal pump fabricated economically and without difficulty from **REPUBLIC TITANIUM**

Mission Manufacturing Company, Houston, Texas, has added a worthy companion to its full line of centrifugal pumps for corrosive and abrasive applications. Shielded-arc welding techniques now permit the use of titanium in its maximum corrosion-resistant form for particularly severe pumping applications.

The pump shown above was fabricated by shaping, welding in an inert gas atmosphere, and machining. It is being used by a leading chemical company to handle ferric chloride at temperatures of about 212°F. The finished pump, incorporating the exclusive Mission Concentric Casing, contains 34 pounds of Republic Titanium.

Performance ratings are essentially similar to those obtained for cast iron or corrosion-resistant alloys.

Fewer pump sizes are required because the flat characteristics of Mission's impeller design provide a wide operating range and sustained efficiencies.

The entire fabricating operation was performed without difficulty and with little change in procedure as compared to other materials of construction.

Does this application of Republic Titanium spark an idea for your product that needs to be strong, light weight, and corrosion-resistant? Republic Metallurgists and Machining Specialists will help you appreciate titanium's advantages now.

Republic produces commercially pure titanium and titanium alloys in ingots, billets, hot rolled and cold finished bars, plates, sheets, and strip. Mail the coupon for more information on these titanium forms, or for metallurgical and machining assistance.

SAVINGS IN MACHINING AND PRODUCTION COSTS of Ace Screw Extractors are obtained by the Henry L. Hanson Company with the help of Republic Cold Drawn Leaded Alloy Steels. Rolling of the extractor spirals formerly required several passes, each followed by an annealing operation. Now, with Republic Leaded Alloy, separate passes can be made deeper, reducing the total number of steps. And, because cold drawing improves the machinability of any given analysis, savings in machining costs are secured. Republic Alloys, Types 4140 and 4150, also provide a high degree of hardness and toughness. These properties in combination with scientific heat treating make the extractors practically unbreakable. Get all the facts on the advantages of Republic Cold Finished Alloy Steels. Mail the coupon today.

LOWER COSTS, IMPROVE QUALITY, INCREASE PRODUCTION with Republic Cold Drawn Special Sections. Because they are formed to the predominating cross-section of the part, Republic Special Sections eliminate or greatly reduce required machining. Results are faster output and lower cost. Also, since cold drawing improves the physical properties of any given analysis, completed parts are stronger and longer wearing. Other advantages may include improved appearance and simplified design. Send coupon for complete facts.

IMPROVED PRODUCT PERFORMANCE is reported by Roamer Steel Boats, Division of Chris-Craft Corporation, since switching to Republic Cold Finished Stainless Steel Bars. Vibration, a mechanical problem caused by out-of-true drive shafts, has been reduced to a minimum by Roamer through standardization of stainless shafts for their line of pleasure cruisers. The shafts are machined from uniformly straight Republic Cold Finished Stainless Steel Bars, Type 304. The bars meet Roamer's strict, maximum tolerance requirement of .006" runout in 72" of shafting. Stainless steel shafts also provide high strength and outstanding corrosion resistance. Republic specialists will help you use Cold Finished Stainless Steel Bars to best advantage. Mail coupon for more information.

NEW! FOR FIGHTING LIQUID FIRES!

ONE-MAN DRY CHEMICAL KILLS MORE FIRE FASTER!

This new Kidde 200-pound pressurized unit has an *extra* 50 pounds of fire-smothering dry chemical, is designed for faster, easier operation. Its 40-foot stream gives more efficient extinguishing action, greater heat protection for the operator! No valves to unscrew, no wait for pressure, no pressure reducer to cause you trouble. Just remove safety pin, flip valve toggle, turn on nozzle lever. No conventional seal. Its exclusive Bridgeman seal holds pressure by using 450 psi to exert a *three-ton* sealing force.

COMPLETELY NEW DRY CHEMICAL LINE GIVES FASTER, EASIER OPERATION!

On the left, the new Kidde 20-pound dry chemical portable — completely new, completely better. The simplest, most efficient dry chemical portable on the market. Features include oversize aluminum handle for gloved-hand operation, perfect balance for faster action, simple one-two operation. Remove horn, pull trigger, and fire's out. Rugged, dustproof pressure gauge is recessed for protection. 10, 20- and 30-pound Kidde portables pressurized at 225-250 psi. Coming soon — new 2½- and 5-lb. models charged at 140-160 psi. Write today for information about this new Kidde line!

LETTER TO THE EDITORS

Series Helps Realize Problem

Your series of management articles expressed me as the best I have seen in business magazines. They are just what you have titled them, Management Series.

They have certainly helped me in analyzing problems encountered by our departments.

I have been clipping these articles from the issues. However, several of the issues I have been fortunate enough to get have been loaned to associates. Consequently, I have lost track of them. You supply me with a copy of each of the 1958 series?

Alan R. Haskins

Administrative Assistant
Continental Machines Inc.
Savage, Minn.

Saving Time Interests Reader

"How To Save Time" (Nov. 10, p. 10) was so interesting that Prof. Norman H. Hiser, who manages industrial training courses at the University of Wisconsin and who is in charge of Allen-Bradley Co.'s administrative training program, asked me to obtain 75 copies of this article. He would like to use it as part of his training program.

A. Dorfman

Assistant Purchasing Agent
Allen-Bradley Co.

PLUS ITEMS

from your
Whitehead Metals
"Supermarkets"

TOOL AND JIG PLATES

Of Alcoa Aluminum, they are stress relieved, non-porous, corrosion-resistant, easily machined. Available in standard size (48" X 96") in 13 thicknesses; or cut to your specifications. Folder available.

WELDING ROD

One-stop service for all you need in Aluminum, Copper Alloys, Nickel Alloys and all major types of welding rod and wire. A full line of soft solders and silver brazing alloys, too. Technical service and complete literature on request.

FOUNDRY ALLOYS

Over 100 different types—largest selection in the industry—available in hand-fuls or carloads off-the-shelf. Technical service, too. Write for "Foundry Alloy" Bulletin FA1.

VALVES

All major types are available from stock in Aluminum, Inconel, Monel, Nickel and Stainless Steel (and plastics, too). Write for descriptive literature.

ARCHITECTURAL SHAPES

Copings, gravel stops and door saddles are just a few of more than two hundred Alcoa aluminum shapes available off the shelf, and illustrated in booklet titled "Shapes." Monel, Stainless and Copper roofing items complete the Whitehead line of architectural materials on hand.

These "Plus Items" and many more are available in addition to a wide selection of corrosion-resistant sheet, rod and tube.

All told, there are more than 20,000 items distributed and serviced by Whitehead. All are available, off-the-shelf, from the nine Whitehead Metal "Supermarkets." All are the products of such leading producers as Alcoa, Anaconda, Inco & Crucible Steel to name just a few.

When you call Whitehead you get fast service, and frank, unbiased help in selection. Technical service when you need it. Add it up and you'll find it pays to

NEW STANLEY TIGHTENERS

Versatile... Lightweight... Sturdy—

The Stanley O Tightener sets a new standard of efficiency for tensioning steel strapping to the required maximum with a manually-operated steel strapping tool with unlimited take-up.

The O Tightener is versatile . . . used to steel strap packages of varying sizes, shapes and weights. Operates with equal ease and speed in any position. Easy to handle, and requiring fewer strokes for take-up, it reduces operator fatigue and saves time. It's a strap-saver too! Applying seals behind tensioning wheel cuts overlap to minimum required for maximum joint security. Tightening action is more positive because there are *two* holding pawls on tensioning wheel. Removal from strapping is instantaneous. The operator returns tightening lever to down position and slides tool from strapping.

FEATURES

- Insertion, alignment of strapping is easy, quick.
- Light weight and balance assure handling ease.
- Sturdy construction means long life.
- Has unlimited take-up.
- Seals may be applied in front of or behind tensioning wheel.

At Steel Door . . .

USS American Springs
thanks to AS&W

In the American Steel & Wire Fatigue Laboratory, a technician runs tests on a USS American Spring, designed for Steel Door use. On the basis of this test a change in hook design was recommended to give longer spring life.

A Steel Door workman assembles a Berry One-Piece Door. This company uses steel exclusively for all doors because of its many consumer advantages. Steel is stable, won't warp or swell. Steel doors need less maintenance and preparation, and steel doors are easy to operate.

This close-up shows the improved hook on the extension springs supplied by American Steel & Wire for the Steel Door overhead garage doors.

stretched 31,000 times and still going strong ...

Spring Engineering Research Service

The Steel Door Corporation, Birmingham, Michigan, is the world's largest manufacturer of residential garage doors. For the production of these doors they use about 150,000 USS American Springs every year. Steel Door asked American Steel & Wire for a statistical evaluation of the fatigue life of the extension hook-type springs they use. The AS&W Spring Engineering Research Service tested these springs in the Fatigue Laboratory and recommended a change in hook design.

So successful was this design change that the life of the springs has been materially increased. At the Steel Door plant a cycle test was set up using USS American Springs on an overhead door. At the present time these springs have completed over 31,000 cycles without showing any sign of failure. This is the equivalent of 25 years of normal usage.

Mr. Ralph Qualman, Advertising Director and Service Manager, says: "It is extremely important that the springs—especially those used on sectional doors where

the strain is greatest—have proper tension and a long life. American Steel & Wire supplies Steel Door with springs that meet their engineering specification and life expectancy."

If you have a spring problem or would like advice on the use of springs in your product, get in touch with our general offices in Cleveland, or any American Steel & Wire Sales Office. You can benefit from the knowledge of AS&W's Spring Engineering Research Service. The Service has been engaged in laboratory experiments of static and dynamic testing for 20 years and has accumulated invaluable data on stress and fatigue life of steel springs, while endeavoring to improve efficiency in the use of steel—from steel chemistry through product application—to more economically cope with today's rigorous demands. This accumulated knowledge of the AS&W Spring Engineering Research Service is at your disposal. *American Steel & Wire, General Offices: Rockefeller Building, Cleveland 13, Ohio.*

Star Power Hack Saw Blades come in a wide assortment of types and sizes. Each is clearly labeled so you know you are using the right blade for the job.

STAR Performers in any Metal Cutting Shop

STAR POWER HACK SAW BLADES and BAND SAW BLADES

Cut metal cutting costs with famous STAR quality blades.

Because they are fabricated from the finest alloyed, properly heat-treated steel, they last longer.

Teeth are formed by specially designed equipment to insure top performance . . . fast, easy cutting.

Star Band Saw Blades are available in Outline, Skip Tooth and Gored-Tooth types for a variety of cutting jobs on ferrous and non-ferrous metals and plastics. Up to and including $\frac{1}{2}$ " size, they are packed in the handy new **Reel-Pac Dispenser**. It brings new convenience to handling and storing band saw blades. You simply draw out the amount you need, any excess withdrawn can be easily slipped back onto the reel. The sturdy, permanent plastic **Reel-Pac** holds 100 feet of blades. Other lengths and sizes as well as welded-to-length in conventional packages.

operation
and
set-up

All feed and traverse movements are selected and operated from the push button station of this new Rockford hydraulic planer. Two-speed traverse motors — high speed for approximate positioning, and slow speed for extremely close power positioning of rail and side heads — eliminate the need for manual positioning in setting-up for a job.

Extra-rugged construction affords use of most modern cutting tools and cutting techniques. The machine is equipped with the new high speed h3 triple circuit.

Get full details on the wide production flexibility of this new hydraulic planer from any Rockford Machine Tool Co. representative, or write directly to us.

integrated CRUCIBLE steel service

Average Crucible warehouse stocks these and many other specialty steel items in a tremendous range of

sizes and analyses. A single phone call will bring any or all of them to you *in the quantity you need.*

keeps 16,000 specialty steel items flowing from mills to local warehouses for immediate delivery to you

Every day, thousands of specialty steel items flow from Crucible mills to Crucible's 27 strategically located warehouses — keeping local stocks at levels that meet customers' *maximum* needs.

Here's how these continually-replenished stocks are helping one steel buyer today. He says:

"We reduced plant inventory to cut operating costs and free working capital and space. This is smart business. But it creates problems, too—like when production requisitions an extra-large order of 36" x 120" Type 304 stainless sheet, 20 ga and 2B finish — *and needs it overnight*. I solve this problem by calling the Crucible warehouse. It's set up to give us the kinds of steels we need from stock."

All 27 Crucible warehouses offer in-stock delivery of approximately 16,000 specialty steel items, ranging from tool steels to stainless sheet and wire. They're able to maintain these high inventories because they're part of Crucible's completely integrated operation, from mining the ore to steelmaking to warehouse delivery to you. If you'd like to know all the ways these warehouses can serve you, phone or visit the one near you today. *Crucible Steel Company of America, Dept. PL15, The Oliver Building, Mellon Square, Pittsburgh 22, Pa.*

STOCK LIST

Keeps you up-to-date on local stocks of specialty steels. Just ask the Crucible salesman to place your name on the regular mailing list.

One Source
For All
These Steels

Inventory specialists keep warehouse stock records up-to-date to give you fast, accurate answers on availability of every analysis.

Steels you ordered yesterday arrive today at your receiving platform — dependably on schedule.

Warehouses maintain modern equipment, like this electronically-controlled flame cutter, for fast processing of specialty items.

TOOL STEELS—Water, oil, air hardening, shock resisting, hot work, plastic and die casting steels in all forms, including bars, sheets, plates, drill rod, hollow bars, forgings and flat ground stocks

HIGH SPEED STEELS—Crucible's famous "Rex"® steels: Rex Thrift Finish rounds, hot rolled and cold drawn flats and squares, drill rod, forgings, sheets, plates, and tool bits

STAINLESS STEELS — Bars, sheet, strip, wire, cold heading wire, metalizing wire, plates, angles

FREE MACHINING STEELS — Crucible Max-el® rounds, hexagons, plates and brake die steel

ALLOY STEELS — Bars, billets, strip and sheet

COLD ROLLED CARBON SPRING STEELS

DRILL STEELS — Hollow and solid drill steels

ALUMINUM EXTRUSION DIE STEELS

HOW THE ENGINEERING SERVICES OF Central Foundry

*help you design better
castings at lower cost*

Many new developments here at Central Foundry have broadened the field of application for castings and have given design engineers greater latitude. To assist you in exploiting these new methods and materials to fullest advantage, each of our engineering departments—design, experimental, process and metallurgy—is at your disposal. Central Foundry is also using a number of testing techniques such as stress analysis, cobalt radiography and sonic testing, that

have proven invaluable in lowering the cost and improving the quality of castings. These procedures help us to determine the best design and method of producing a casting, either by the green sand method or the shell mold process, and the best material for the casting, either grey iron, malleable iron or ArmaSteel.

Central Foundry has the capacity to deliver, on schedule, quality castings in production quantities.

STRESS ANALYSIS FOR IMPROVED DESIGN

An important part of our engineering services is the stress analysis laboratory. Stress analysis discovers the amount of stress on a part due to its service function and is an important aid in determining and improving the strength of a part. Improved casting design can be accomplished through the use of stress-analysis by more effectively distributing the metal in the part. The U-bolt anchor plate shown here is a case in point. Our customer was experiencing failures in this part and asked us to see what we could do to solve the problem. Using stress analysis the part was completely redesigned for maximum efficiency. The redesigned part is 35% stronger, 42% lighter and less costly.

EXCELLENT MACHINABILITY FOR INCREASED PRODUCTION

CENTRAL FOUNDRY DIVISION

REDESIGN FOR STRENGTH

This is a rear spring clip pad that was converted to a casting with the help of stress analysis. The clip pad supports the shock absorber arm and clamps the spring to the rear axle of an automobile. When produced as a stamping, this part weighed 4-1/4 pounds. However, when designed as an ArmaSteel casting, weight was reduced to 2-9/10 pounds. Most important, based on comparative stress analysis tests, the casting is 30% stronger than the stamping. (In addition, the holes are produced by the foundry, making it unnecessary for the customer to punch them.) This conversion from a stamping to a casting resulted not only in increased strength, but in substantial cost savings, as well.

REDESIGN FOR IMPROVED PRODUCT AND ECONOMY

Many of our customers have found that redesigning a product to be made as an ArmaSteel casting rather than as a fabrication, forging or stamping, has resulted in a better part at less cost. The fabricated design of a rear wheel truck hub at the left consists of a forged base with a steel plate welded in place to form the smaller flange. The casting on the right, designed jointly by the customer and our engineers, is of single piece construction, is lighter, stronger and less costly than the fabricated design and eliminates the fitting and welding of the small flange.

FABRICATED DESIGN

ARMASTEEL CASTING

PROCESS ENGINEERING FOR LOWER COST

Our process engineers are continually looking for ways to more economically produce castings, thus lowering the finished-product cost. Shown here is a single casting that combines 5 bearing caps used on a V-8 engine. The casting is almost completely machined as a single piece, and the parts are then separated in a final operation. Substantial savings are realized in both casting and machining costs.

COBALT RADIOGRAPHY FOR ASSURED QUALITY

Radiography, by means of Cobalt 60, has drastically reduced the time required to check castings and is an important aid in obtaining the best possible casting quality. In an effort to eliminate a machining operation on the universal joint yoke shown here, a design change was made in the tube section of the part. When sample castings of the new design were checked radiographically, it was immediately apparent that the design was unsatisfactory since it caused acute metal feeding problems. By redesigning and further checking by radiography, Central Foundry was able to produce, in the shortest possible time, a lighter casting which required less machining in our customer's plant.

SHELL MOLDING FOR GREATER ACCURACY

Shell molding, a relatively new process of making castings, is now being employed extensively for fast, simple production of complicated castings, such as those requiring narrow, accurate passages and cross sections. It is practically impossible to produce certain parts in any other way without prohibitive costs; this is especially true of ferrous metals. Complicated parts like the manual control valve body shown here, a part of the automatic transmission of a military vehicle, are readily cast in grey iron when the shell process is utilized. The part had been considered as an aluminum die casting, but was thought unsatisfactory because of adverse expansion and wear characteristics. In this case, meeting the requirements for very close tolerances on the thickness and location of ports was made possible by the shell molding process.

REDESIGN FOR WEIGHT REDUCTION

Vehicle weight reduction is a matter of increasing importance to design engineers . . . and more and more existing parts are being converted from a low or medium to a high strength ferrous material such as ArmaSteel. On the left is a grey iron differential carrier currently used in an automobile. By taking advantage of the superior physical properties of ArmaSteel, it was possible to design the part on the right which is five pounds lighter. The modulus of elasticity of ArmaSteel is approximately 60% greater (the tensile strength about twice as great) than the grey iron material.

helpful suggestions

FOR MODERN FORGING PROCEDURE

The Forger The Forger

ARTICLE NO. 21

MULTIPLE OPERATION OFFSET FORGINGS

The problem of making a forging having the upset portion offset from the center line of the shank is an interesting project. A description of dies to produce a forging of this type, with a minimum of flash or waste, may be helpful to the reader.

When upsetting a piece of round stock it is a well-known fact that the material will be equally distributed around the circumference, increasing the diameter.

It also has been observed that when upsetting square or rectangular stock, the upset portion has a tendency to form a circular shape.

With these facts in mind, it can easily be seen that if an offset forging is formed on the end of a bar without first gathering the material in an off-center position, an unequal flash will occur. This is not only wasteful, but also it decreases die life and makes difficult the fitting of the cavity by choking off the flow of material. An examination of the dies in the accompanying illustration will indicate a method of overcoming the irregular flash by initially offsetting the forging from its shank.

Sketch "A" shows the different steps necessary to form a crankshaft.

Item #1 shows the portion of the blank that is heated, having the front end cold, thereby locating the heat where it is most effective. The cold end will resist any tendency of metal flowing around the heading tool.

Item #2 shows the blank bent or offset, while Item #3 illustrates the upset metal.

The bending as illustrated in Item #2 and the upsetting shown in Item #3 are accomplished in a single operation.

By using offset dies as shown in Figure "B" the blank will be offset by the closing of the dies and the advancing heading tool pushes the material back into the cavity.

The offset cavity should be designed so as to form a graceful curve, thereby eliminating any chance of a fold forming in the next operation.

Item #4 illustrates the completed forging with flash, forming in the next operation.

This offset head is formed in a cavity in the heading tool, which is set to allow for possible overflow or flash.

Item #5 illustrates the completed crankshaft forging, with the flash removed. This is done in the third cavity with the dies by pushing the forging through the trimming inserts.

Figure "B" shows a set of dies used to forge the crankshaft as described above. Upon examining this you will note a backstop which has two functions: first, as a gauge for positioning the cut blank and, second, as a guide for locating the offset so that the heading tool in the second

operation will match this offset. This is effected by the use of a guide piece that is welded to the offset rings used to handle the blank.

OPERATIONS TO FORGE CRANKSHAFT
SKETCH "A"

You are invited to have your name placed on our mailing list to receive this valuable series of articles on up-to-date forging methods and procedures. We will be glad to send a complete set of twenty one issues of "The Forger" in addition to placing your name on our mailing list to receive future articles as they are prepared. There is absolutely no charge for this service. We are glad to make this good will contribution to the advancement of modern forging practice as executed on ACME XN Forging Machines.

of Quality Stainless Sheet
and Strip in the Industry

J & L's Completely New Stainless Mill.

designed and engineered to give you the fastest delivery on Quality Stainless Sheet and Strip

Now you can demand the quality you need and get the service you want from the most advanced stainless steel sheet and strip source in the industry. J & L's new Sendzimir Mill at Louisville, Ohio, is the result of years of planning by specialists to provide a new facility of such perfection that yield of the highest quality is assured.

J & L can now offer stainless sheet and strip to the most exacting specifications, producing stainless sheets with extremely close tolerances in widths up to 48 inches.

By efficient, flexible scheduling and adequate inventory support, J & L offers stainless steel buyers everywhere the fastest possible service.

The type of tubing you need is here

It pays to analyze your tubing requirements with a Ryerson tubing specialist. He is well qualified to help you select the right tubing for your purpose from Ryerson's diversified stocks.

The Ryerson specialist knows tubing—knows what will work best and why. In many cases, he can

recommend a type that will do a better job for you—perhaps a newer type that will save you money, either in first cost or in the cost of using it.

Ryerson carries the nation's largest stocks of steel tubing—all of

certified quality—and uses the finest modern equipment to cut to your exact specifications. And Ryerson delivers fast—one tube or a thousand.

The Ryerson tubing specialist is as close as your telephone. Give him a call today.

RYERSON STEEL®

Member of the **INLAND** Steel Family

Tubing in stock: Seamless and welded mechanical tubing; fluid line, pump cylinder and structural tubing; stainless pipe and tubing; PVC pipe and fittings. Also, aluminum tubing in many plants.

Metalworking Outlook

Autos Roll Faster

The strike-plagued automotive industry has finally shifted to high but hasn't reached overdrive yet. Auto assemblies hit 148,000 last week, the highest for the year, but that's still below the year-ago levels. Studebaker-Packard Corp.'s walkout didn't help, and Chrysler Corp. was still struggling for full momentum after its many work stoppages. Bargaining talks between United Auto Workers and International Harvester Co. have been recessed until today (Dec. 1). Late last week, the month-and-a-half strike by the UAW against Caterpillar Tractor Co. appeared no closer to solution.

The Re-employment 'Lag'

Get set for a big union campaign aimed at the public and the new Congress, charging that the present lag in re-employment is a threat to continued recovery. The AFL-CIO's Economic Policy Committee has fired the opening barrage. Its monthly economic report says that factory output went up 9 per cent between April and September, while factory jobs increased only 2 per cent. Every employer knows this is normal. And on the down side, jobs decline more slowly than production falls. Unemployment fell to a low of 1.9 million in the 1955-57 boom, then rose to a recession peak of 5.4 million last June. But rising productivity and a growing labor force will make it difficult to reduce joblessness below 3 million in the near future.

Steelworkers' Fringes Jump

Fringe benefits to steelworkers now average 75 cents an hour, vs. 63 cents last year. Average hourly payments by steel companies for straight-time work have more than doubled since 1947, but fringes have jumped about four and a half times, says the American Iron & Steel Institute.

World Steel Output Dips

World steel production totaled 216.3 million net tons in the first nine months, vs. 244 million in the same period of 1957. Every major nation's output declined except Russia's, which jumped from 41.6 million tons last year to 45 million in the 1958 period. The European Coal & Steel Community's production fell only slightly—from 48.6 million tons to 48.2 million. The U. S., of course, had the sharpest drop—from 87.7 million tons to 59.1 million.

America's Ferrous Expansion

Despite America's poor steel year, look for continued expansion. Principal programs (started, finished, or in progress this year) include: 20 rolling mills; more than 20 million tons of new sintering capacity installed; new continuous annealing lines, new steelmaking furnaces, mostly electric, plus enlargement and rebuilding of other furnaces; new electrolytic tin plate lines; coke oven batteries; new pipe mills; a new battery of soaking pits; a new coal

Metalworking

Outlook

cleaning plant; an iron powder plant; several giant ladles; new research centers; pilot facilities; and completion of a \$300 million taconite project.

Machinery's Recovery Uneven

Watch new orders for machinery. Of all segments of the economy hit by the recession, this one has been socked the hardest. Since last January, new orders have trended upward, although unevenly. They have probably retraced, on the average, nearly half the 1956-58 decline. New orders for cutting-type machine tools amounted to \$28.5 million in October, compared with \$20.1 million in September and the average of \$22.2 million for the first nine months. Resistance welding equipment makers received \$2.9 million in new orders in October, vs. \$1.1 million in September. But industrial furnace makers didn't fare so well—new orders of \$3.1 million in October were 36 per cent below September's.

Transistors: 66 Million in '59

Look for 66 million transistors to be sold in 1959, vs. 44 million in 1958 and 13 million in 1956, the year the device came into its own. Next year's volume of \$140 million will go into portable radios and phonographs (\$30 million), auto radios (\$10 million), and industrial military uses (\$100 million).

Defense Tries To Hold Budget Line

The Pentagon has just started to cut back, stretch out, and cancel. The Navy will terminate its Seamaster program with delivery of 14 of the 80-ton jets instead of 24. Savings: Nearly \$60 million. Observers expect cuts in our IRBM to come soon. Other candidates for cuts or cancellations: The Titan ICBM, the Nike Hercules or Bomarc, and the Talos. The extent of missile duplication is indicated by Association of Missile & Rocket Industries. It says we have six ICBM projects, four IRBM, 16 drone-type missiles, 20 experimental birds, eight with 100-1500-mile ranges, 18 with 20-100-mile ranges, and 15 with ranges under 20 miles.

Kaiser Shows Aluminum Car

Detroiters are flocking to see an all-aluminum car displayed by Kaiser Aluminum & Chemical Sales Inc. Called the Pele, the car has body panels of stamped aluminum. Doors are two-piece, diecast aluminum with sculptured exterior. Center sections of both front and rear bumpers are aluminum extrusions. The entire front-end structure is made from aluminum sheets.

Straws in the Wind

Future pace of the business recovery will be much slower in coming months, believes Dr. John K. Langum of Business Economics Inc. . . . Consumer prices remained steady in October at 123.7 of the 1947-49 average . . . Rail freight rates jump 17 per cent in Canada today (Dec. 1).

No Job too big or too tough . . . for MARVEL "Giant" Hack Saws

These giant MARVEL Hydraulic Hack Saws (No. 18, Capacity 18" x 18"; and No. 24, Capacity 24" x 24") were *basically* designed for rapid and economical cut-off of BIG WORK. They are not merely "conventional" designs "stretched" to big capacity. They are truly designed and built with the ruggedness and rigidity necessary to withstand the rough treatment of sawing big work, even though the work is in the "toughest of the tough" alloys.

They are reliably fulfilling the cut-off requirements in innumerable steel mills, forge shops, structural shops, warehouses, and machine shops, with assured low tool cost and minimum kerf loss of steel.

In addition to cutting-off, they are reducing costs by eliminating further machining operations. Heat treated die blocks are being reclaimed for re-sinking by sawing off the worn face; columns, beams, pipe, and tubing are being sawed to *finished*, square ends, eliminating milling; angular sawing is done conveniently by swinging the upper structure on the base, to any angle up to 45 degrees—*without moving the work*.

Contemplating the modern trend toward ever tougher steels and larger sizes, these are the logical sawing machines to buy, not only for today's needs but for tomorrow's as well.

Weirton equips cold strip mill with double-poured Ni-hard working rolls

Ni-Hard nickel-chromium cast iron provides hardness of 80 to 82 Shore...provides long life, consistently good finish

Weirton Steel Company, a division of National Steel Corporation, is using double-poured Ni-Hard* nickel-chromium alloy iron working rolls on all five stands of its cold strip mill. These Ni-Hard rolls are 23-inches in diameter with a 52-inch face. Six stands in Weirton's hot strip mill are also equipped with Ni-Hard rolls.

Why Ni-Hard working rolls? Ni-Hard cast iron possesses a matrix structure in the mold cooled condition that is akin to that of heat treated steel. In addition, it contains a multitude of refined carbides which make an important contribution to its abrasion resistance. The resulting structure has great hardness, strength, and resistance to impact.

For your applications. Ni-Hard alloy possesses the fluidity and freezing range of the cast irons and can readily cast in all forms and shapes common to the iron and steel foundry. If you'd like specific information concerning its application to your abrasion problem, write Inco. For details on double-poured Ni-Hard rolls, write the fabricator, United Engineering Company.

Depreciation Reform:

Let's Get Together!

Do you know that you may be paying 80 per cent taxes instead of the statutory rate of 52 per cent?

Such overtaxing is primarily the result of inadequate allowances for the depreciation of machinery and equipment which force corporations to overstate their taxable income.

As STEEL has pointed out in a series of editorials and articles this year, something should be done about it. At one time it looked as if relief would come from the last session of Congress, but proposed legislation failed—either because of the apathy of congressmen, or businessmen, or both.

Now the issue is again getting national attention. Accountants, lawyers, economists, and businessmen gathered at the Tax Institute Inc., Princeton, N. J., late last month to sit in on a depreciation forum.

The overwhelming majority agreed that depreciation inadequacies are the greatest single source of concern over the fairness of our present tax structure—with the possible exception of the level of the rates themselves.

Two general approaches were advanced:

1. Calculate depreciation on the current dollar cost equivalent of the investment instead of on the original cost basis.
2. Reform the mechanics of present methods of figuring allowances, but within the historical original cost framework.

Under the first approach, reinvestment depreciation gets wide support. It works like this: When depreciable property is disposed of or otherwise retired, you figure the current dollars needed to replace the asset by referring to a price index. In effect, the difference between original cost and the cost in current dollars would be allowed as a tax deduction if you make capital expenditures.

Under the second approach, one method classifies depreciable property by useful lives in ten or fifteen age brackets. Most equipment could be written off in five to ten years. Another method would allow a triple-rate declining balance system instead of the present double rate.

Both approaches are reasonable, but the point is this: There were about as many pet variations on the basic depreciation systems as there were experts at the forum. If even the experts can't agree (the majority of the nation's tax authorities were there), how can industry expect Congress to remedy the situation?

We think the time has come for industry to consolidate its forces, so it can present a unified front to the next session of Congress.

Irwin H. Such

EDITOR-IN-CHIEF

Three-time ABC winner, famous bowler **BILL LILLARD** slams in strike after strike sending ball and pins flying against piece of **TI-CO** set up in pit. Close up examination by Bill shows plenty of punishment but no flaking. **TI-CO's** zinc coating rolled with the punch!

BOWLING CHAMP FAILS TO FLAKE INLAND

TI-CO!

Switch to **TI-CO** Non-Flaking Galvanized saves manufacturing up to 15% in Production Costs

A well-known garage door manufacturer dispensed with plating operations—reduced costs 10%. A leading furnace manufacturer saved \$20 per thousand parts produced eliminating cleaning and painting. A company making roller gravity conveyors cut out similar operations. These are just a few of many case histories of manufacturers who realized important savings and improved their product when they started using **TI-CO** Galvanized Sheets.

Whenever a product requires the strength of steel, plus corrosion resistance, Inland **TI-CO** is the most satisfactory . . . the most practical . . . the most economical material to use. That's because **TI-CO** is produced with a zinc coating that will not flake even under the toughest conditions. The coating stretches with the base metal during fabrication. Deep drawing, brake or roll forming, crimping, stamping, lock-seaming even severe spin-drawing . . . **TI-CO** takes them all in stride with no flaking or peeling. With **TI-CO** there's no need for costly dipping or touching up. And the uniform, bright spangled finish adds to the over-all attractiveness of the product.

*If you're manufacturing or designing a metal product that requires corrosion resistance, consider **TI-CO** Galvanized Sheets. Manufactured in coils or cut lengths up to 60" widths, gauges 8 to 30 inclusive. Consult your local steel distributor or Inland sales representative. Write today for a free informative booklet on **TI-CO**.*

Millions of net tons of steel

Steel Inventory Trend Line To Climb Steadily in '59

It is expected to reach 14 million tons by yearend, 16 million tons in the first quarter of '59, 19 million tons in the second quarter. Liquidation ended in August

STEEL INVENTORIES are on the uptrend even though many consumers are trying to keep their stocks at a minimum.

By the end of the year, producers and fabricators will have 14 million tons of steel in their stockpiles—1 million more than they had at the August low point, but 5 million

less than on Dec. 31, 1957.

During the first half of 1959, they'll add 5 million tons to their inventories—2 million in the first quarter and 3 million in the second.

• **Contrast with '58**—During the first eight months, consumers reduced their stocks by 6 million tons.

"The business executive realized that leadtime had evaporated," says F. Russell Widmer, commercial research director of Republic Steel Corp. "He could secure materials on an overnight basis. He was producing for an expanding market but found a declining market. The reaction was instantaneous and simultaneous. Thousands of fists were banged on an equal number of desks with the orders: 'Don't buy another damned thing!'"

Liquidation ended in August, when stocks fell to the minimum working level—about 13 million tons. September was a month of inventory stability, despite a moderate buildup in the automotive industry. Steelmakers shipped 5.9 tons of steel to the automakers for every motor vehicle (car, truck, or bus) they assembled. In the first seven months, shipments didn't exceed 1.89 tons per vehicle. (About 2 tons are required to make each unit.)

• **October Upturn**—Consumers began to replenish their inventories in October, and the rate of growth was accelerated by unusual circumstances: 1. Autoworkers left their jobs over local grievances, halting production and causing stockpiles to back up. 2. Tin plate users bought heavily in anticipation of a Nov. 1 price increase. Many appliance makers also abandoned hand-to-mouth purchasing as retail sales improved. Commercial research men at one mill estimate that finished steel stocks increased by 700,000 tons in October alone.

"The October buildup doesn't reflect a general reversal of inventory policy," a marketing expert comments, "but there's little doubt that the corner has been turned." How much steel will be added to inventories during the fourth quarter? Industry estimates run from 500,000 to 1.2 million tons. Those who suggest the smaller figure argue that production and consumption are pretty well balanced at a 75 per cent operating rate.

Today's level is about 13.75 million tons, and consumers' stocks of almost all products are considered low. Oil drillers may still be over-

loaded with specialties, but they're running short of the bread-and-butter items (5½ and 7 in. OD tubing and casing). Structural fabricators have cut their inventories of plates and shapes to the bone. In many cases, they put off buying steel until they're awarded a job and can order from the bill of materials. Even standard rail stocks are probably low in terms of track laying plans for 1959 and the carriers' improved earning prospects. Inventories of steel service centers are in good shape (above 3.3 million tons), says the American Steel Warehouse Association. Since the first of the year, they've been reduced about 10 per cent.

• **Outlook for '59**—The threat of a steel strike may cause consumers to beef up their stocks next year, but some market analysts foresee less of a scramble than usual. Says Mr. Widmer: "Steel capacity is expected to be 146 million tons. There is no probability of shortages even at seasonal peaks of demand. Even the possibility of a steel strike in the third quarter and the protection inventory consumers will accumulate should not unduly lengthen delivery times.

"Unlike the periods of recovery following recessions of 1949 and 1954, next year should see inventories accumulate only as required by a slowly increasing demand for end items, with a little extra for strike protection."

In deciding how much to buy and how soon, consumers will be influenced by three considerations: 1. The steel industry's increased capacity. 2. The possibility of a strike. 3. Their own business prospects. Although some mills think their customers won't hedge as much in 1959 as in prior years, others expect no departure from tradition.

"We just can't move from 75 to 100 per cent of capacity overnight," warns a leading producer. "Even if we had 200 million tons of capacity, there would be a period when the customer who had been getting overnight delivery would have to settle for delivery in two or three weeks. With just one bottleneck, all hell can break loose in a manufacturing plant.

"What purchasing agent wants to risk that?"

U.S. Wire Mills Want Help

FOUR U. S. WIRE producers (Atlantic Steel Co., Continental Steel Corp., Keystone Steel & Wire Co., and Northwestern Steel & Wire Co.) have filed with the Tariff Commission for an investigation of damage being done to their industry by imports.

The four mills accounted for 34 per cent of the barbed wire, 24 per cent of the wire nails, and 30 per cent of the woven wire fence shipped by the U. S. steel industry in 1957.

• **Dark Future** — In 1947, imports of those products were under 100 tons. In 1957, they hit 228,073 tons. Domestic shipments fell from 1.5 million tons in 1947 to under 750,000 tons in 1957.

Edwin Martin, counsel for the mills, adds that prices of imports are so low that large quantities are entering midwestern markets. With the completion of the St. Lawrence Seaway, domestic producers fear further inroads into their markets. "At least one large manufacturer has ceased marketing barbed wire and

another has almost reached the point," notes the application.

Mill spokesmen also charge that many importers represent the products as "made to U. S. specifications," or as being the same types made under U. S. brand names.

Such practices, say the mills, cost the U. S. 4.75 million manhours labor (or about \$14 million wages) in 1957.

• **Tariff or Quotas?**—To partially meet lower prices of imported products, domestic producers are asking for increased tariffs. The aim: Help the advantage over domestic prices at principal ports of entry to \$1 a short ton. The mills don't say what quotas would satisfy them should the commission turn down higher tariffs.

Present duties: Barbed wire free; 0.25 cent per pound on galvanized fence and fencing wire; 0.5 cent per pound on Class A nails; 0.5 cent per pound on Class B nails; 1.25 cents per pound on Class C nails.

Will Steel Case Go to High Court?

COMPANIES planning to grow through acquisitions are closely scrutinizing their chances to get "marriage licenses." Go-ahead signs from the federal government will be increasingly hard to get because the U. S. has thus far stopped the Bethlehem-Youngstown merger. Last week, Bethlehem Steel Corp. and Youngstown Sheet & Tube Co. were still undecided about whether to appeal Judge Weinfeld's decision. If they don't appeal, a big damper goes on other contemplated mergers. If they do appeal, industry will mark time until the final decision.

• **Huge Campaign**—Judge Weinfeld's decision is a big victory for the Justice Department, now conducting a vigorous antimerger drive; it has eight major antitrust cases in various stages of litigation. And the Federal Trade Commission is handling more merger cases this year than ever before.

• **Precedent**—If the case is appealed and if the Supreme Court upholds Judge Weinfeld, the U. S. will have a more powerful weapon in Section 7 of the Clayton Act, which prohibits corporate acquisitions when the effect would be to "substantially lessen competition or tend to create a monopoly." How potent the weapon will be depends on the scope of the high court's opinion.

• **The Timetable**—If there is an appeal, lawyers expect the Supreme Court to rule by late '59 or early '60. The steel companies have 60 days to appeal to the high tribunal. Then both sides are allowed 170 days to file notices, records, and motions. That will take almost until June, when the court adjourns until October.

• **Homer's Views** — Arthur B. Homer, Bethlehem's president, contends that the merger would strengthen, rather than lessen, competition. He says the marriage would introduce a strong, new, competitive force in the Midwest since Bethlehem would add substantial steelmaking and finishing capacity at both of Youngstown's plants.

Bethlehem, Youngstown still debating whether to appeal Weinfeld decision. Big factor is that court voted 4 to 2 in '57 against DuPont-GM tie. Here are justices' backgrounds

**Chief Justice
Earl Warren**

A California Republican appointed by Eisenhower, he voted with the majority in the Du Pont case.

Hugo L. Black

An Alabama Democrat appointed by Roosevelt, he voted with the majority in the Du Pont case and is considered by court observers to be generally opposed to mergers.

Felix Frankfurter

A Roosevelt-appointed Democrat from Massachusetts, he is the only man on the present court who voted in favor of Du Pont's. But court observers say he tends to refuse to reverse the decision of a lower court.

William O. Douglas

This Washington Democrat and Roosevelt appointee voted with the majority in the Du Pont case and is generally opposed to mergers, observers say.

Tom C. Clark

Texan, Democrat, and Truman appointee, he didn't vote in the Du Pont case.

John M. Harlan

This New York Republican appointed by Eisenhower is generally regarded as a moderate.

William J. Brennan

From New Jersey, he is the only Democrat appointed by Ike. He wrote the majority opinion in the Du Pont case.

Charles Whittaker

A Mississippi Republican and Ike appointee, he has considerable experience as a corporation lawyer, is generally considered a conservative.

Potter Stewart

An Ohio Republican appointed by Ike, he is considered a conservative who would not reverse the decision of a lower court except under extreme circumstances.

1. Justice Burton, who recently resigned, was the other.

Breakeven Point: Route to Better Decision Making

EVERYDAY DECISIONS have a tremendous effect on profits. If you're looking for a better basis on which to make them, E. A. Cyrol, Chicago management consultant, suggests an approach that has paid off for his clients:

- **What It Is**—It's the breakeven point concept yanked out of the ivory tower and put to work on the shop floor. It's fast and fairly simple. You can control the degree of accuracy. It's not a strict formula. Rather, it's a way of thinking that can make you more important to your company. It can be used in production, purchasing, marketing, and many other areas. Mr. Cyrol says it is a way to "find cost relationships ahead of time."

It's not revolutionary; you may subconsciously use it now. But close adherence to the principles involved will sharpen your judgment, help you justify your decisions, and bolster your reputation as a manager.

For example, with the economy snapping back now, your production may be picking up and you want to rehire some men in your department. You can use this concept to determine how many you need and prove it to the boss.

Or you can use it to justify the purchase of a new piece of equipment—if that machine would honestly pay for itself (this approach will let you determine that, too).

Or, if you're a purchasing agent, this is a good approach to make or buy decisions.

Mr. Cyrol is explaining the concept at regional meetings of the National Metal Trades Association.

- **Example No. 1**—The concept can be effectively used on any management level. Suppose you are the production manager of a machine shop. You want to know whether it would be cheaper to machine a small lot on a turret lathe or an automatic screw machine. Say the setup cost is \$3 for the automatic

and \$1.50 for the turret lathe. That's your starting point. Then compute other important costs (tooling, amortization, direct labor, fringe benefits, and any other significant cost that varies between the two methods). Say that figures out to \$4.80 an hour for the turret lathe and \$4.60 an hour for the automatic (although other costs are higher on the automatic, direct labor is lower because one operator runs several machines—four in this example).

Say machining time per piece is 1 minute on the screw machine and 1.9 minutes on the lathe. That means cost per piece is 15.2 cents for the lathe and 7.7 cents for the automatic. Graphically, it would look like the chart below. It instantly shows you which machine to use, depending upon the length of run. A 30-piece lot, for example, would be cheaper to run on the automatic.

- **Example No. 2**—Suppose you are thinking about lowering your selling price on one product. Your market research director tells you that a 5 per cent price reduction would boost sales about 20 per cent; the current annual sales rate for the item is \$320,000. Would the price cut pay off? Not in this case (see chart). Sales would have to reach \$400,000 under the new price structure before profits would equal those at the \$320,000 sales level with old prices.

E. A. CYROL

- **Example No. 3**—Here's how a breakeven chart is set up (below). Note that profit per sales dollar should grow larger as sales mount because you'll be spreading your fixed costs over a larger number of items.

- **Example No. 4**—If you buy new equipment to both expand capacity and lower unit manufacturing costs

you'll change that picture (chart, Example 3) to look like the chart below.

The added capitalization increases fixed costs, so your breakeven point moves to the right. Now net sales will have to exceed \$400,000 before profit per sales dollar will equal what it was before the expansion. However, if sales hit, say \$500,000, your profit per sales dollar is greater due to the new equipment.

• Example No. 5—Trimming labor costs is probably the most effective way to lower your breakeven point. It is equally effective in widening your cone of profit:

• Train Yourself—Use this concept as a guide to sharpen your decisions. On minor matters, you can visualize the problem. For major decisions, it's worthwhile to use the formal procedure (compute all costs and draw a chart). One big advantage of this approach is its flexibility: You can figure costs down to the penny or use estimates—depending on the scope of the problem.

An extra copy of this article is available until supply is exhausted. Write Editorial Service, STEEL, Penton Bldg., Cleveland 13, Ohio.

Plastics Buck the Recession

Year	Production	
	Synthetic Plastic, Resin Materials	
1958*	2.2 million tons
1957	2.1 million
1956	1.9 million
1955	1.8 million
1954	1.4 million
1950	1.0 million

Source—Society of the Plastics Industry Inc.
*Estimated.

METALWORKERS who used to deride plastics are finding they can't get away from the synthetic. It represents a market, a way to diversify, and is often a tool to be used in improving their products.

An equipment builder attending the National Plastic Exposition in Chicago describes the material's importance to metalworking this way: "It's a tough, top quality competitor in many applications. For equipment builders, it's a growing market. For others it offers opportunities for cost cutting, product improvement, and diversification."

Equipment builders watched many of their metalworking markets shrivel this year, but sales of machines for the plastic industry were active.

• Examples—Logan Hydraulics Inc., a subsidiary of Logan Engineering Co., reports sales are 15 per cent higher than last year's. The Plastics Div. of Fellows Gear Shaper Co. says its sales will equal last year's.

Hydraulic Press Mfg. Co. says 50 per cent of its over-all volume goes into plastics. To date its sales are 15 per cent ahead of last year's.

This year, National Automatic Tool Co. Inc. introduced a new injection molding machine which features a shockless hydraulic system. Officials feel the line will soon provide a "substantial" percentage of over-all company sales.

• Where It's Used—Strictly speaking, there is no such thing as a plastics industry. It's more a foster child to other industries. Equipment builders say more than half their sales go to captive operations.

Eleven basic types of plastics are used; each has its own properties.

About 30 million lb of reinforced plastics will be used in construction this year. B. F. Goodrich Chemical Co. has developed a new type of plastic-coated aluminum aimed at the home building market.

Auto and appliance makers are using more plastics. Stewart-Warner Corp. set up an injection molding department and lopped 40 per cent off the cost of making odometer dials—about 10 million annually.

The Naugatuck Chemical Div., U. S. Rubber Co., has a process for continuously laminating sheet vinyl to steel. Production this year will hit 25 million sq ft, officials estimate, and by 1960 should top 100 million sq ft annually. Applications include auto parts, TV cabinets, luggage, and furniture.

About 10 per cent of this year's output of plastics will go into packaging.

• Drawback—Relatively low resistance to heat has been one of the chief limitations of plastics. H. E. Humphreys Jr., chairman, U. S. Rubber, predicts early development of plastics withstanding 1000 to 1500° F.

Industry Prepares Three Plans of Attack

AIRCRAFT INDUSTRIES ASSOCIATION TACTICS:

Seek to negate industry loss of incentive profits by amending the act so that a certain amount of a company's earnings cannot be touched by the board. Win the right to appeal as far as the U. S. Court of Appeals.

MAPI TACTICS:

Amend the act so that it applies only to top defense contractors making most of their

money from the government. The object: Protect smaller firms making barely enough money to qualify them as subject to renegotiation.

NSIA TACTICS:

Kill the act. Short of that, blunt the board's emphasis on net worth as a determinant for excess profits. The board uses net worth to turn renegotiation into a profit ceiling, something it wasn't intended to be, says NSIA.

Lack of Unity May Stall Foes of Renegotiation

DEFENSE CONTRACTORS will have their first real opportunity to challenge renegotiation when the next Congress convenes, but don't look for a co-ordinated attack—a shortcoming that hurt industry's campaign for depreciation reform during the last session.

The 85th Congress extended the law for only six months—it expires on June 30, 1959. Previous Congressional hearings on the subject (since the Korean War) have been little more than skirmishes. Renegotiation was expected to survive without change. But the situation could be different this time.

Companies will soon be approached by the Joint Internal Revenue Taxation Committee. Big associations are preparing Madison Avenue pitches for the Ways & Means and Finance committees.

But some Washington observers aren't too optimistic because the de-

fense contractors are not setting up a concerted, all-out attack. Most of them merely plan to snipe at certain phases of renegotiation, and they don't even agree on how to do that. Renegotiation could get through the next session practically untouched.

Here are some of the pet programs:

- **Aircraft**—The industry with the biggest stake will be represented by the Aircraft Industries Association, which has no intention of asking that the act be killed. Instead, its blows will be concentrated against loss of incentive profits.

Several types of defense contracts allow the contractor to keep up to 20 per cent of the profits gained through increased efficiency. The Renegotiation Board won't allow industry to keep the money, says the AIA, because it uses an annual

accounting basis, rather than a contract basis, when it examines a firm. "Only windfalls should be taken away, not incentives," argues a spokesman.

The association will offer amendment to the act which essentially will shift the burden of proof from the company to the board. It will ask that a certain amount (probably 8 to 10 per cent) of a company's earnings which is above those originally conceived in the contract be regarded as untouchable by the board.

"This," says AIA, "is simply asking for a certain amount of flexibility in the profit picture. If we get that, then we are willing to fight with the board about the other 10 per cent." The amendment would apply to all contracts, not just those with incentive clauses.

AIA doesn't want renegotiation killed because many of its mem-

haven't had their profits cleared by the board since 1954. To kill the bill without amendment would permit the board to renegotiate five years of contracts (1954-58) on the old basis.

NSIA is dropping part of the approach that Rep. Cecil King (D., Calif.) offered at the last session. He wanted the cases conducted on a courtlike basis with an open record. NSIA feels it can build a sufficient record in appeals to the U. S. Tax Court. It does want the right to appeal to the U. S. Court of Appeals (the House agreed to it, but the Senate didn't).

Equipment Makers — The Machinery & Allied Products Institute is concerned about the board's power to hit a firm when it makes barely enough profit to put it over the \$1 million floor. Where there is a loss, notes a spokesman for MAPI, the statute is clear, but "inadequate" profits are not defined to give the company a break. "If profits jump from extreme low to high, the board takes the average. But the low profits don't balance the high ones because a company is supposed to make some money in our system."

Electronics—MAPI is also looking ahead at the electronics industry. Large firms have had experience with renegotiation and know their way around, but "cold war babies of the new era of military technology, which have grown up on government research contracts, are going to be hit." Smaller companies also have a larger burden to carry because their profits-to-sales percentage may run higher than larger firms'. Renegotiation should be confined to top defense contractors making most of their money from the government, believes this MAPI source.

Net Worth—The National Security Industrial Association flatly states: "In view of the price revision techniques available, such as redetermination and incentive contracts, the armed services need no help from the Renegotiation Board." Short of the law's death, NSIA wants to blunt the emphasis on net worth as a determinant for excess profits.

"It should be treated as an initial

indicator, not a statutory factor," notes one source. The board uses the net worth formula to turn renegotiation into a profit ceiling, something it was never intended to be, argues NSIA. The Senate Finance Committee said in 1951: "Return on net worth might not in many cases be an adequate measure of profits."

NSIA claims the board's emphasis on net worth encourages inefficient contractors, fails to adequately measure one industry against another (because net worth varies greatly from one to another), does not take into account replacement costs, de-emphasizes the risk an advanced weapon contractor may take (where another making a standard military item takes little risk), and fails to measure a firm's total contribution to the defense effort.

• **Warning: Danger**—One association spokesman says his own group is divided on what to do about renegotiation. Some member firms even suggest returning to the Vinson-Trammel Act, which allowed only a flat percentage profit on defense business. Others feel renegotiation gives them a clean bill of health and they needn't worry about Congressional investigations.

A government informant calls industry's unwillingness to create a solid front "little short of ridiculous." He adds: "Any arguments for renegotiation can only be based on the assumption that something worse could happen to industry. I'm not sure that is possible."

A trade group spokesman thinks MAPI's warning that more small companies will soon be involved is well taken. "It involves all industry in the new age of technology," he says, "because any company worth its salt is getting a share of government work to stay up with its competitors." His own members, he adds, remain largely "disinterested" in renegotiation reform.

• **Too Sophisticated** — "The large firms have become too sophisticated about renegotiation," charges another. With special accounting systems, they can write off costs that would be difficult for smaller companies to justify. They also have staffs trained for renegotiation work (which they write off as proper costs), thus tending to allow them-

selves to think they are making out as well as they can." One of the two points of view seems to rule their contact with the Renegotiation Board: 1. "To hell with them; we won't tell them anything. Let them do their worst." 2. "We lean over backwards to co-operate with the board, so they will give us a break."

The to-hell-with-them attitude pushes the board into acts it wouldn't consider if industry faced up to the problems of renegotiation and attacked them in Congress. (The board's reliance on net worth is a result of that attitude, believes a Capitol Hill source.)

The let-them-do-their-worst attitude allows the board to obtain product-by-product cost data on government and nongovernment business. (It is believed by some sources that the board's attention to nongovernment work is illegal, but where a contractor can show some losses, he tends to get better treatment, so many firms go along with the request.)

• **Personnel Problems**—Here's industry's real dilemma, in the opinion of one spokesman: "The board's personnel are not up to their job." He asks: "Can the board, with its unfavorable quarters (in a war-built temporary building) and relatively low salaries, command the type man who has the knowledge to judge whether North American should make \$10 million or \$20 million in one year?"

Most sources agree that board personnel are honest, but usually add "mediocre." If industry should demand better talent from the board, it would also have to ask for extension of the act on a permanent basis. Government agencies with a life expectancy of six months to two years cannot find the best people.

New Shipwork Load Down

Contracts for four new merchant vessels, the first since last March, were made with U. S. shipbuilders last month, says the Shipbuilders Council of America.

Eighty-seven vessels (2,779,300 tons) are now under construction or on order, 11 ships (700,000 tons) less than a year ago.

Smooth Sailing for Shipbuilders?

"OUR merchant marine will continue to be subsidized as far as one can see ahead," notes Commerce Secretary Lewis Strauss. Coming from such a firm believer in the free enterprise system, the statement points up the plight of our shipbuilders, who will appeal to Congress next session for increased subsidies for U. S. shipping firms.

Sen. Warren Magnuson (D., Wash.) chairman of the Interstate & Foreign Commerce Committee, which guides subsidy bills through Congress, warned last week that competition from foreign yards, particularly Japan's, is stepping up. Backlogs of our shipbuilders are dropping, despite the plan to replace much of our merchant fleet in the next decade or so.

Ike's Plans May Mean Rough Waters

With all the federal agencies standing in line for more money, President Eisenhower's order to hold the line on spending is particularly serious for the Maritime Administration. It has just awarded the largest construction subsidy in history to Lykes Bros. Steamship Co. (almost 50 per cent of the cost of four ships). Future awards presumably will have to be cut back to stay within Ike's order.

Grading the agencies' chances for more money next session, you come up with this outlook for the maritime folks: They'll stand far back in the line now forming at the Budget Bureau's door.

Other Agencies Need Money, Too

Defense must be first in line because it accounts for half the federal budget. To stay below the \$40.8 billion estimated for fiscal 1959, some tremendous cuts would have to be made in missile and space spending—a pretty sacred area so far. Foreign aid, which Congress sliced more than \$650 million below Ike's original request, may get the same treatment in the new session, but administration sponsored loan programs (designed to make up for declining direct aid) will cut into those savings.

Two home front areas—agriculture and mining—will get close attention from the administration and Congress. With farm income scheduled to fall about

5 per cent next year, it would appear to be political suicide for the Republicans to try to hold down subsidies. The Interior Department is expected to reject the Seaton Plan for the mining interests. Congress will want to go farther than Ike plans in both areas.

Chances are strong for more housing money from Uncle Sam next year (up to \$34 billion may be authorized).

You can see where shipbuilding subsidies are. The fact that they can't be decreased (if we were to have a merchant marine) indicates how little our general budget will be cut by Ike and how great the chances are for a whopping increase by Congress.

Support for 'Gas' Tax Is Lacking

The President will ask for a 1.5 cent a gallon increase in the gasoline tax to save the Federal Highway Trust Fund from sinking clear out of sight. The funds, in the red for the last four months, must find new revenue sources (like more gasoline taxes), or Treasury's general funds if our road programs are to stay on schedule.

But where is the support for higher taxes? Already the American Automobile Association and the National Grange, two powerful groups, have stated they will not go along with Ike's request.

The 49 states can be expected to pressure their congressmen to avoid higher taxes. Gasoline taxes are a sure source of revenue for states, and they don't like the federal government taking too much of the pie. Maybe \$1 billion will have to be authorized to be used next session as a stopgap until Congress can figure out a new formula for building them without hurting anyone's pocketbook.

Atomic Plane's Future Role Told

Maj. Gen. Donald Keirn, chief of the Air Force Atomic Energy Commission program for developing the atomic plane (STEEL, Nov. 24, p. 60), made one of his rare public statements on its status last week. Coming at budgetmaking time in the Pentagon, his has special significance because of Ike's order to hold down spending. The general leaves no doubt as to his position on our need for a militarily useful plane. "An ideal manned aircraft system must carry a large payload and remain on nomadic patrol for extended periods in various areas of the world."

Progress report: The general claims radiation hazards are not as extreme as some scientists claim, that the A-plane will have the speed and altitude capability of a chemically powered plane by using chemical fuel burners, and that more attention should be devoted to the hardware for such a ship, rather than concentrating research to materials only.

General Keirn concludes: "We are now on the threshold of success in various technological areas and will soon be ready to embark on an experimental flight development phase looking toward a prototype aircraft."

CHASE IS ROLLING SHEET ALUMINUM

...and Chase as your aluminum source gives you all these advantages!

LONG EXPERIENCE — For years Chase has been rolling aluminum for special applications, along with other metals, giving Chase unrivalled non-ferrous metals experience...82 years working with metals!

LATEST EQUIPMENT for quality production and exacting production techniques assure close tolerance controls required in narrow-width rolling of aluminum for use in fin stock, in deep drawing, and spinning and in eyelet parts.

HUGE STOCKS of semi-finished aluminum at Chase Cleveland and Waterbury mills assure you quick delivery of coiled sheet to meet your exact needs.

DEPENDABLE SUPPLY — because Chase can draw on unlimited stocks of raw metal.

* * *

Talk over your requirements with your Chase District Office, or write Chase, Waterbury 20, Connecticut.

1952	334	231

*Estimated by STEEL.

Metal Furniture Men Hopeful

FORECAST: Metal furniture shipments in 1959 will exceed 1958's by some \$69 million, but probably won't equal 1957 figures (see table).

Production of 1.5 million chairs, 775,000 desks, 1.6 million noninsulated filing units, and 75,000 insulated filing cabinets is included in manufacturers' plans for next year.

A STEEL survey of the industry shows that demand turned up slightly in the fourth quarter. Shipments through September were trailing last year's by about 20 per cent, but October volume moved a little ahead of the same month last year.

• **Prices**—Arthur R. Hedeman, vice president, Shaw-Walker Co., Muskegon, Mich., says: "Although there have been some slight adjustments, there have been few general price increases to cover higher steel

and other costs. Competition has been one factor in this."

M. L. Levin, president, Business Equipment Corp., Boston, thinks the upward trend will continue through 1959. J. G. Whitrock, sales manager, Western Mfg. Co., Aurora, Ill., describes prices as "firmer than at any time in the past two years." He adds that no adverse reaction has been felt in the few spots where small price hikes were felt to be necessary this fall.

• **Materials**—More aluminum and fiber glass are being used in production of household metal furniture, reports Otto W. Molla, vice president, Molla Inc., Westbury, N. Y. A trend has also been noted toward knockdown construction for easier and more economical shipping and to standard fasteners for assembly, he adds.

Tubular steel, for the most part joined by welding and brazing, is

the principal material used by Huron Chrome Products Co., Marion, Ind.

New products and design improvement should provide sales impetus in the next few months, predicts a spokesman for Security Steel Equipment Co., Avenel, N. J., but they're not expected to materially alter the ratio of metals used.

Dollar value of metal used in construction of office furniture is 4.3 times greater than the value of wood used in making comparable products. On the other hand, value of wood used for household furniture is three times that of metal in such applications.

The industry will consume about 680,000 tons of metal in 1959 (mostly steel) of which some 370,000 tons will go into home furniture. Close to 125,000 tons will be in the form of wire for upholstery spring coils and bedsprings.

About 310,000 tons of carbon steel, wrought iron, and castings will be needed next year. Aluminum mill shapes and castings will account for another 20,000 tons.

Purchasing Directors Keep The Machines Running

THE PURCHASING DIRECTOR is a key member of the management team. Through his hands pass better than 50 per cent of his company's dollar outlays. How well he does his job directly affects his company's earnings. Any savings he makes show up as profit. Any misstep in purchasing is a direct loss to the company.

• **His Duties**—The top purchasing man is first of all a manager.

William H. Old, director of purchases for Babcock & Wilcox Co., New York, "looks at the forest instead of chopping down the trees" in his capacity of staff chief of B&W's purchasing operation. His responsibilities: Direct, co-ordinate, and standardize over-all policy; maintain good vender relations; supply management with special records and reports when it needs them; maintain liaison with other departments (he has authority to

work with anyone in any division); establish policy and procedures of a company-wide nature; co-ordinate purchases when advantageous; and develop techniques to improve his function.

Richard N. Chapin, general purchasing agent for Air Reduction Co. Inc., New York, calls his job a line function. Besides supervising and co-ordinating purchasing, his daily routine brings him into direct contact with buying, vender analysis and selection, standardization, substitution, and value analysis, as well as training of buyers.

Rodney Plimpton, purchasing agent for Electro Dynamic Div., General Dynamics Corp., Bayonne, N. J., says he: "Supervises purchasing of all materials and services, sets purchasing policy, selects vendors, hires and fires purchasing personnel, sits in on major management meetings, acts as chairman of the inventory control committee, and

makes recommendations on make or buy decisions."

• **Who Is He?**—The purchasing chief is known by a variety of titles. Most common is still "purchasing agent" (see exhibit) but the trend is toward such titles as vice president purchasing, director of purchasing and manager of materials.

The average director is in the 50 to 55 age bracket. He has been with his company about nine years (STEEL's survey shows length of service varies from less than one year to 45 years). The majority of respondents became No. 1 men in purchasing within eight years after entering the field (28 per cent started at the top).

• **His Background**—Only 14 per cent of directors contacted by STEEL started their careers in purchasing. The survey uncovered previous occupations (see exhibit).

Fewer than half of those surveyed have college degrees. You can look for that to change in another ten years. Most younger men taking over departments are university trained.

Engineering is becoming increasingly popular as a training ground

in STEEL's survey, engineers in purchasing were topped only by men holding sheepskins in business administration.

His Qualifications—Every purchasing executive has his own pet list of the personal and professional qualifications that make a topnotch director. Probably at the top of everyone's list is inquisitiveness or imagination—continually striving to improve purchasing's effectiveness. Right alongside is integrity—the ability to withstand pressures from inside as well as outside.

Professionally, the purchasing director must be intimately acquainted with market conditions, price trends, suppliers, and all the mechanics of efficient purchasing (everything from automated order systems to tools like value analysis). Says Howard Ahl, executive secretary of the National Association of Purchasing Agents: "The purchasing director should know what's going on in the plant and understand the problems of production and engineering."

His Salary—Salaries (see Page 48) are on the rise but in many cases they are still not on a par with those of men holding comparable titles. Sales of most firms surveyed by STEEL range between \$1 million and \$20 million. There is little correlation between the purchasing man's salary and his company's business volume: A man in a company doing \$5 million often makes more than his counterpart in a firm doing \$10 million. One reason: Many firms have no yardsticks for measuring purchasing's worth. Over the \$20 million mark, salaries begin to become more closely allied with sales. College graduates normally make out better than men without degrees.

Companies with sales in excess of \$100 million generally pay their purchasing directors at least \$25,000. A few make over \$100,000 and at least one is in the plus \$350,000 range.

His Attitude—The purchasing director likes his job. He knows a real challenge exists in getting maximum benefit out of his operation.

An extra copy of this article is available until supply is exhausted. Write Editorial Service, STEEL, Penton Bldg., Cleveland 13, Ohio.

Profile of a Purchasing Man

DAVID L. GIBSON is typical of the nontypical modern purchasing executives who have revolutionized the concept of that field in the last ten years. He bears little resemblance to his counterpart of pre-World War II days who merely "filled someone else's requisition."

"He lives, breathes, eats, and thinks purchasing," says his opposite number in another metalworking company.

That is important when you're vice president of purchases for a multiplant company like Worthington Corp., Harrison, N. J. It has more than 10,000 employees and did \$190 million worth of business last year in such diverse items as pumps and compressors, air conditioning equipment, diesel engines and steam turbines, motors and generators, valves, and instruments.

• **RESPONSIBILITIES**—Under Worthington's decentralized purchasing setup (each plant handles its own buying rather than having it done on a central corporate basis), Mr. Gibson functions in a staff rather than a line capacity. His 1001 duties include: Develop and interpret purchasing policies and procedures, negotiate company-wide purchase agreements, advise plant purchasing managers, negotiate large real estate transactions, assist in training purchasing personnel, advise on inventories, function as corporate traffic chief.

• **LONG HOURS**—His workday doesn't stop at 5 p.m. Like many other metalworking executives, he uses the evening hours for cleaning up details, business reading, writing, speaking engagements, and plain thinking. It adds up to an average workday of 12 hours.

• **EXPERIENCE**—How do you get to be a purchasing executive? For David Gibson, it started with a major in mechanical engineering at Rutgers University (class of 1924). He joined Worthington right after graduation. For 27 years, he "prepped" for purchasing—first as a student engineer, then as a salesman, merchandising sales manager, manager of priorities, and executive secretary of the war contracts termination committee. In 1951, he officially joined the purchasing family as assistant to the vice president-purchases. He later rose to general manager of purchases and, on May 1 of this year, to vice president-purchases.

• **PHILOSOPHY**—Mr. Gibson feels a purchasing man should not spread himself too thin. "I can't subscribe completely to the materials manager concept when so many things remain to be done in effective purchasing itself. (Examples: Negotiation, vendor selection, standardization, substitution.)"

Purchasing doesn't have to be a dead end street, believes Mr. Gibson. "A man with the right background, training, and drive has the opportunity to go to the top in purchasing and then possibly higher into company management."

He has a line of successors trained if the need ever arises. "In every job I have held, there were at least three men back of me qualified to move up the ladder. A man can't advance in purchasing (or any other job) unless he has trained the men under him to be ready for a bigger job."

• **TARGET**—"Purchasing's biggest job today is to show it is more than a service function. We have to prove to management that purchasing has a place in the company's profit picture."

GRINDING WHEELS

Grinding with a corn cob?

It's a fact! In the new U. S. Lo-Temp Cup Wheel, ground-up corn cobs are blended into the batch with some remarkable results:

Greater wheel porosity, thereby preventing the wheel from burning the metal, even at top speeds • greater uniformity within the wheel — and from one wheel to another • greater strength and resistance to wear, therefore, longer life and wheel economy • greater resistance to centrifugal stress.

As any grinding wheel operator will quickly discover, this amazing new "corn-fed" U. S. Lo-Temp Cup Wheel permits him to do a more craftsmanlike job more quickly, more surely, more safely.

The U. S. Lo-Temp is just one of several new grinding wheel developments coming from U. S. Rubber. Get in touch with wheel specialists through U. S. Rubber, 30 N. Hill St., Mishawaka, Indiana, your local "U. S." District office, or by writing us at address below.

Inset shows actual U. S. Lo-Temp Cup Wheel.

Mechanical Goods Division

United States Rubber

WORLD'S LARGEST MANUFACTURER OF INDUSTRIAL RUBBER PRODUCTS

Rockefeller Center, New York 20, N.Y.

In Canada: Dominion Rubber Company, Ltd.

At Chevrolet's 1959 press review, General Manager Edward N. Cole remarked: "Many owners spend a lot of time trying to take some of the pesky little bugs out of their new cars. In fulfilling its responsibility to owners, Chevrolet has assigned two 'squeak and rattle' engineers to track down and eliminate these petty annoyances."

Richard P. James, senior experimental engineer, and William E. Hart of Chevrolet's engineering center are the two sharp-eared gentlemen who drew the unusual assignment.

MR. HART

MR. JAMES

Shhh! Chevy Noise Patrol at Work!

EVER BUY a new car and two weeks later find yourself arguing with the dealer because he can't find and correct half a dozen little squeaks and rattles? If this hasn't happened to you, you're either easy to please or extremely lucky.

Theoretically, every car Detroit turns out should be design perfect. It is easy for design engineers to blame the manufacturing process and quality control. But these same engineers are quick to admit the near impossibility of designing some 14,000 parts so they'll go together without any squeaky fits.

• **Little Noises** — As car designs have improved, the over-all noise level has dropped. Many previously unheard rattles stemming from design irregularities have become acoustically irksome. It's a problem that quality control can't do much about. What's needed is a small crew of production engineers who can follow each year's models from the drawing board through manufacturing so minor mistakes can be spotted and corrected be-

fore the cars go into full production.

• **Sleuths**—That is exactly what William Hart and Richard James do at Chevrolet's engineering center, Warren, Mich. They're the two engineers Mr. Cole was talking about. While other engineers and designers are checking functionality and making sure parts are designed so they can be easily manufactured and assembled, Mr. Hart and Mr. James are searching for design misfits that might make noise.

All automakers are aware of the problem. They attack it in research labs, during basic design, and in manufacturing and assembly. The sleuthing approach is added at Chevrolet.

• **On Drawing Boards**—"A good 20 months before the cars go into production we check layouts to see if there are any design changes that can be made to prevent poor fits.

"About a year before production starts, a design mockup is made to check fits and dimensions of all parts that will go into the new

model. At this stage, we look for redesigned parts to see how they fit with parts that haven't been changed that year," explains Mr. Hart.

• **Prototype Models** — Some eight months before production, functional prototype cars are built by hand at Chevy's Flint, Mich., assembly plant. The prototype jobs are choice hunting grounds for squeaks and rattles.

Last year, for example, the rear door lock on one of the four-door models sounded like a tuning fork when the door was slammed. Reason: Slight design changes allowed one of the door lock springs to vibrate too much. Solution: Rather than redesign, Chevrolet figured it was cheaper to rubber coat the spring to damp out excessive vibrations.

"It's easy to correct noises at this time. Usually, all it takes is a call to the design engineer or production department responsible for the part," says Mr. Hart.

• **Pilot Line Runs**—A month ahead

(Material in this department is protected by copyright, and its use in any form without permission is prohibited.)

"Entries are piling up like autumn leaves," reports our Beat-the-Experts editor. "Everybody is getting into the act . . . from presidents to mail boys." Here are the rules: The forecaster who most nearly pegs the number of cars to be built in the U. S. from Jan. 1 through June 30, 1959, will win a scale model of General Motors' Firebird III. Ten runner-ups will get full color prints of a dream car rendered by George Walker, Ford's vice president and director of styling.

of production, pilot line cars start rolling off assembly lines. Those cars ultimately are sold, but before they get to dealers, Mr. Hart and Mr. James shake them down to check for loose fits caused by lack of fasteners or inadequate reinforcement. They also listen for peculiar exhaust or ride "booms" that show up only in road tests.

"We don't use any special instrumentation because these are noises the car owner might hear in his routine driving, but when you get used to listening, these sounds just seem to leap out at you," Mr. James asserts.

That's how he and Mr. Hart discovered that the tail pipe on one of the '59 models was knocking against the lateral control bar bracket beneath the car. Manufacturing eliminated this rattle by flattening the tail pipe slightly at the point of contact.

• **After Introduction**—For at least six months after the new models appear, Mr. Hart and Mr. James man their listening posts to check for noises as parts begin to wear. Usually, they drive one of the 200 cars delivered to the engineering center for testing purposes, but sometimes they pick newly assembled cars to see whether a recurring rattle is caused by a design fault or stems from inadequate quality control.

"We make running changes in designs until we're so close to the model runout that it's cheaper to correct the defects in the new models that will be coming out in a

few months," explains Mr. Hart. Testing usually winds up in March or April.

• **Supplier Parts** — Sometimes the noisemakers are purchased from vendors. Mr. James recalls the case of the rattling rewind knob. Chevrolet was buying its clocks from two sources. Some clocks rattled; others didn't. Mr. James found that one manufacturer was putting a small rubber grommet on the clock rewind knob to keep it from knocking against the instrument case.

Chevrolet got the other supplies do the same and the noise stops.

In case you're wondering, a team of engineers found and eliminated 15 or 20 noises on 1959 pilot models. Among the correctives were the addition of a spring washer to a dummy tone control knob on the radio, putting a rubber gasket around the speedometer housing base, and placing a spacer between the hub of the steering wheel and the steering column so the hub won't bind or hit the directional signal lever housing.

If your new Chevy rattles, Mr. Hart says you should make sure the noise is caused by faulty design rather than a quality control slip before you write a letter about it. If you do write, he hopes you send the letter to STEEL instead of to him. Chances are the kind of noise you are hearing has been eliminated on later cars by a running change. If not, it undoubtedly is being heard in cars being tested.

Exclaims Mr. Hart: "Believe me it's bothering us more than it is you!"

Exhaust Notes

• De Soto has introduced its Adventurer model, a limited production luxury car which basically has the Firelite body with special trim. It's available in two door hardtop and convertible styles.

• A total of 12,031 Simcas was sold in the U. S. in the first nine months, vs. 3374 in the same period of 1957.

NOW greater economy, improved quality with JOHNSON *Continucast** 105" bronze bars

Now famous Johnson quality solid and tubular bronze bars are being produced by a continuous casting method to give you the economy and convenience of 105" lengths.

CONTINUCAST bars are economical because your distributor will cut this long bar in multiples of a variety of lengths to suit your requirements. You buy and handle less metal—pay for only the metal you use.

The continuous casting method improves the physical qualities of the Johnson alloy 72 (SAE 660). Internal and surface defects are eliminated and the distribution of lead and other elements is more uniform. This improves machinability, makes for longer tool life. You also get greater tensile, yield, impact and fatigue properties.

Johnson **CONTINUCAST** 105" Bronze Bars are available in 21 sizes of solid bars from $\frac{1}{2}$ " to 3" in diameter, and in 118 sizes of tubular bars which range from $\frac{1}{2}$ " to 2 $\frac{1}{2}$ " ID and from 1" to 3" OD.

To get the benefit of greater economy and quality of **CONTINUCAST** bars ask your distributor to supply you. For further information write for folder JBL-14.

Where to look for hidden savings

- Fastener value-analysis shows big dollar savings
- Quality improved at same time

If you know what to look for, there are sizable savings to be found in standard fasteners. See what happened when the *RB&W Fastener Man* analyzed fastener usage:

Shown the merits of high strength bolts, a company standardized on them exclusively, saved \$12,000 the first year, \$28,000 the next.

Showing a manufacturer how to substitute high strength bolts for heavy head milled bolts, the RB&W Fastener Man pointed to a \$4,500 annual saving on this item alone.

At a plant with 23,000 different fastener items in inventory, more than half were eliminated...cutting costs from buying to assembly.

Where special fasteners were used in heavy equipment, substituting cap screws offered \$13,000 saving on a production run of 500 units.

So it goes. Using high carbon cap screws where costlier socket screws are not really needed... cap screws for studs and nuts in certain applications... replacing machined parts with cold headed pieces... there are plenty of ways to economize.

Take a look at your own fastener usage through the eyes of an RB&W Fastener Man. Contact Russell, Burdsall & Ward Bolt and Nut Co.

RB&W

PLANT IN LOS ANGELES

Other plants: Port Chester, N. Y.;
Coraopolis, Pa.; Rock Falls, Ill.

HEX and HEX a major step in fastener simplification

Under the new, RB&W Hex Hex program, one hex head 1 and hex nut consolidates the features of four other frequently used fastening units, all of which are intended to do the same job.

Simplifies inventory, speeds turnover. Streamlines ordering, stocking and usage.

Improves quality and appearance in the popular size range. In heading hex bolts, flow lines in the steel are distorted less than in square bolts. Strength is greater, tolerances closer. Hex heads are more attractive, too.

Cuts weight, reducing handling cost. For example, 1,000 Hex and Hex units in the 1/2" x 2" size weigh 25% less than comparable square head bolts and square nuts.

wrench takes hold faster

proper seating on either side

Speeds assembly. Hex permits faster, easier wrenching. Double chamfered hex nuts allow correct assembly from either side.

Cost no more than square head bolts and square nuts. Yet, look at the advantages. Ask the RB&W Man about it. Or, write for Bulletin HH-1.

Production Index at 15-Month High

STEEL's industrial production index reached a preliminary 154 (1947-49 = 100) for the week ended Nov. 22, a 15-month high and only 1 point shy of the August, 1957, peak that preceded the recession. It is well below the all-time peak of 168 set in early December, 1956.

It does not mean that the economy as a whole has regained all its lost ground, but it does indicate that the uptrend has been solidly based and that it should continue well into 1959. But the pace is certain to slow down once the effects of the big push from the auto industry have been spent. That will come in January or February.

• **Paradox**—Because our index is not seasonally adjusted, a simple comparison between the current level and the August, 1957, level is misleading. (The Federal Reserve Board's index, which is seasonally adjusted, still lagged the prerecession peak by 7 percentage points in October. The margin will be cut by 2 or 3 points for November.) But the seeming paradox can be explained by examining the individual components.

The two biggest factors in the recovery are electricity output and auto production. The weekly figures from the Edison Electric Institute put a built-in growth factor

into any raw index. Even at the recession's deepest point, the nation's utilities were generating almost as much electricity as they did during better business times because of the expansion in population and private, commercial, and government use.

In the case of autos, the industry

is just recovering from severe strike damage; it was going into model changeovers when the last peak in the index was reached.

• **Better Indication**—Steel production and freight carloadings come closer to showing the relationship between the two periods. Output

NIAGARA Aero HEAT EXCHANGER quickly pulls down the initial peak load of heat in quenching ... and saves cooling water

● You gain in accurate control of quench bath temperatures and quickly effective capacity to handle initial peak load of heat in quenching. You prevent production set-backs, increase the output of your heat treating department, prevent oil fires, save losses from rejected parts.

Niagara Aero Heat Exchangers give you this control in both furnace and induction hardening methods. They prevent both over-heating and over-cooling of the quench bath. Hundreds of heat treaters know they prevent many troubles, constantly improve quality and increase production.

They quickly pay for themselves by saving cooling water coils and extend your quench capacity without extra water or cooling tower.

Write for Bulletins 120 and 132 giving complete information.

now is running close to 2 million tons of steel a week, compared with 2.1 million before the recession. That gap is closing, partly because of today's improved business and partly because of last year's downtrend.

Freight carloadings are virtually even with the year-ago totals (for the first time in 15 months), but they are still considerably below the prerecession level. Part of that is because of the seasonal decline which started four weeks ago, but there is no denying that goods just are not being shipped at the rate of some of 1957's better months.

Charts Show Broad Base

The composite presented by the weekly graphs and tables compiled by STEEL (four of which are shown above) provides better insight into what is happening to business, particularly metalworking. Out of 45 separate statistical series, 31 show that in the latest month of record conditions were better than they were in the previous month. (Most of the data cover September and October.) Improvement was shown by only 20 in July and 19 a year ago. In the latest month on record, ten were still below the month-

ago figures, and four were about even.

On a year-to-year basis, though, it is still evident that there is much room for improvement. Thirteen series are above the corresponding 1957 levels (compared with eight in July and ten a year ago) while 31 are behind.

Shipments and production have made the biggest comeback. Out of 20 series, 19 are above the prior month's levels. Six of the 20 are now above the year-ago level. Notable in this group are the appliances. Only three production statistics were above the corresponding 1957 levels in July.

Seven of the 11 statistics on new orders are above the prior month's figures. The same seven showed month-to-month improvement in July. The capital goods industries are still the slowest performers. While new orders for only one group were ahead of the 1957 level last July, today improvement is seen in three series.

Backlogs are the weakest element. They are continuing to decline in the industries tabulated, mainly foundries and the railroad industry.

Prices and wages, as expected, are well above the year-ago level.

Foundry Equipment Mfrs. Assn.

but on a month-to-month basis, they have leveled off a great deal.

Bellwether Shows Uptrend

One of metalworking's most sensitive bellwether industries points to further strengthening of the uptrend. New orders for screw machine products for the month of September reached the highest level since October, 1957, reports the National Screw Machine Products Association. They were 7 per cent above the August total, representing the fifth consecutive month in which orders have topped shipments.

Appliances Take the Lead

Appliances continue to be among the better performers in the recovery. In the composite mentioned above, they accounted for a good part of the month-to-month improvement in the production score. At the same time, they accounted for the only setback. In October, home washing machines lagged behind the September pace by 5 per cent after showing steady gains through most of the fall (see table, Page 56).

But home laundry appliances as

a whole had the best month in two years, exceeded only by the peak month of October, 1956, reports the American Home Laundry Manufacturers' Association. Factory sales of gas dryers and washer-dryers set all-time highs.

The improvement in vacuum cleaner sales noted in the graph above has narrowed the gap between the first ten months of this year and the corresponding period of 1957 to less than 1 per cent. Earlier in the year it was as much as 12 per cent. October's sales compare favorably with the best months in the industry's history.

Incorporations Set Record

The improved business situation is reflected in the uptrend in business incorporations and the slackening off in failures. Dun & Bradstreet Inc. reports that October was the best month on record for new charters. The 13,633 total was 1.6 per cent better than the previous high established in March, 1955.

Failures in the week ended Nov. 13 dropped off to 274, says D&B, marking the sixth time in the last three months that the weekly total has dipped beneath the year-ago figure.

.010 to .001 25" wide; down to .00015 in narrower widths.

All regular commercial tempers.

Commercial bright anneal finish.

Unique annealing facilities provide uniform temper and uncontaminated surface.

Coils or cut lengths, both with #3 edge.

302, 305, 321, 347, 430, 17-7PH, PH15-7MO plus various high temperature alloys and rare metals.

Available for prompt shipment in production quantities.

FOR EXACTING STANDARDS ONLY

Need a crane for a WIDE bay?

Industrial heavy service, cab operated Multiple Runway Crane spans 100 feet in an appliance plant. ASCE rail on bridge and runways for high speed and heavy service.

Industrial

Multiple runway cranes provide crane coverage over widest bays

If you are planning an extra wide shop bay requiring overhead crane service and still want to keep floor areas clear of supporting pillars, *Industrial's* Multiple Runway Crane will fill the bill. Multiple runways allow minimum depth and weight of crane bridge and eliminate intermediate supporting pillars even on extremely long spans. This member of the versatile *Industrial* crane family is ideal for warehouse or similar application where wide, unobstructed floor space is at a premium.

Trouble-free service is built into *Industrial* Multiple Runway Cranes with engineering features proved superior in *Industrial* standard high quality underhung cranes:

- Forged steel heat treated wheels.*
- Patented removable axles.
- Flexible couplings throughout.
- Gear drive enclosed in oil bath.
- Jig-assembled and jig-bored end trucks with large gusset plates for perfect alignment.
- Precision ball and roller bearings.
- Channel or truss type outrigger standard equipment for extra support.

*All driver wheels are heat treated for extra wear.

Industrial Heavy Service

Underhung Track Section.

This heavy service *Industrial* track combines the durability of a high carbon manganese running surface with the safety of a ductile structural I-beam load-bearing member.

One of three *Industrial* floor operated, 15 ton Multiple Runway Cranes installed in an aircraft factory. Cranes span 130 feet. ▼

To obtain fullest economy from *Industrial's* Multiple Runway Crane in new or existing building, consult with *Industrial* engineers. *Industrial* makes many other types of overhead and jib cranes and can recommend the type and size that will best fill your needs. Send for Catalogs.

NICHOLAS M. ADAMS
National Aluminate v. p.

ADAM J. ALT
Wilbur B. Driver supt.

J. D. MATTIMORE
Tube Turns v. p.

Roland Lehr was elected president of Gear Grinding Machine Co., Detroit. He continues as president of Baker Bros. Inc., Toledo, Ohio.

Nicholas M. Adams was named vice president of National Aluminate Corp., Chicago, and general manager, oil products and chemical division. He was president of Oil Products & Chemical Co., recently acquired by National.

Andrew W. Rose was elected president, Byron Jackson Div., Los Angeles, Borg-Warner Corp. He succeeds E. S. Dulin, now chairman. Mr. Rose, now chief executive officer, was vice president and assistant to the president.

R. B. McMullin was made extrusion product manager for Kaiser Aluminum & Chemical Sales Inc. He has headquarters in Chicago.

Nathan Cohn, former manager, market development division, fills the new post of vice president-technical affairs of Leeds & Northrup Co., Philadelphia. He is responsible for supervision of the research and development department, the engineering department, and the patent division. Donald E. Moat, director-marketing, was made vice president-marketing. John F. Quereau, director-manufacturing, was made vice president-manufacturing.

McCormick Selph Associates, Hollister, Calif., appointed Dr. Frank J. Lavacot director of research and development. He was head, propulsion systems division, U. S. Naval Ordnance test station.

Adam J. Alt was promoted to general superintendent, Wilbur B. Driver Co., Newark, N. J. He was director of production control.

Harry G. Smith, manager of A. O. Smith Corp.'s meter division at Los Angeles, was named president and general manager of the recently acquired Erie Meter Systems Inc., Erie, Pa. L. F. Smith (no relation) continues at Erie as vice president-operations.

Melvin F. House Jr. was made plant superintendent, Michigan Seamless Tube Co., South Lyon, Mich. He was assistant plant superintendent.

Charles C. Snider was made director of sales, Consolidated Electrodynamics Corp., Pasadena, Calif. Former sales manager, he succeeds William F. Johnson, recently named director of the company's newly formed sales engineering department.

Gilbert A. Hanke was named product manager, stainless tubing, Allegheny Ludlum Steel Corp., Pittsburgh. He is succeeded by Thomas J. Gorman as general superintendent, extrusion and cold draw department, Watervliet, N. Y., Works.

Edwin J. Mejia, vice president, was elected chief sales management officer of Aluminium Ltd., Montreal, Que. Mr. Mejia resigns as chief employee relations officer to accept the appointment, effective Dec. 31, when he succeeds Elmer G. MacDowell, resigned. Mr. MacDowell will continue as a director and vice president of the company.

J. D. Mattimore was made vice president for product engineering and research, Tube Turns Div., Louisville, Chemeron Corp. He has been director of its product engineering and research department.

John J. Heidenreich was named manager, production control, at the Brackenridge, Pa., Works, Allegheny Ludlum Steel Corp. He was superintendent of production planning, and is succeeded by W. J. Mentzer.

Morse G. Dial, president, Union Carbide Corp., New York, assumes the new office of chairman, and continues as chief executive officer. Howard S. Bunn, executive vice president, becomes president. Kenneth H. Hannan continues as executive vice president, and Birny Mason Jr., vice president, becomes executive vice president.

William A. McCullough Jr. was appointed sales manager, W. O. Barnes Co. Inc., Detroit. He succeeds Vernon H. Olson, recently elected president. Mr. McCullough was assistant domestic sales manager at Nicholson File Co.

James F. Orr succeeds Arthur T. Newell (retiring Jan. 1) as works manager, Henderson, Nev., Stauffer Chemical Co. Leonard J. Edwards was made assistant works manager. Mr. Newell will continue in a consulting capacity.

Dr. Wilfred A. Bychinsky was made chief engineer of automotive products for AC Spark Plug Div., Flint, Mich., General Motors Corp. He succeeds Leo W. Tobin Jr., recently

CHARLES I. MacGUFFIE
Air Reduction dept. mgr.

CHARLES M. GEORGE
Gardner-Denver v. p.

EARL L. WRIGHT
Mine & Smelter Supply post

EDWARD N. WRENSHALL
Kerotest general manager

made manager of AC's Milwaukee operations.

Charles I. MacGuffie was appointed manager of Air Reduction Sales Co.'s new special products department, organized to provide engineering assistance to customers. It is an expansion of the machine welding department organized in 1955. Mr. MacGuffie's office is in New York. Formerly, he was manager of marketing, welding department, General Electric Co. **J. H. Berryman**, previously manager, machine welding department, was named general sales manager of the new department.

Elmer Lehmkuhl was appointed sales manager, Arcair Co., Lancaster, Ohio, responsible for marketing and sales of products in the eastern division.

A. M. Kelly was made San Francisco district sales manager for Duff-Norton Co.

Arthur H. Uhler was made western regional director, Richards-Wilcox Mfg. Co., Aurora, Ill. Effective Jan. 1, the office of the western region will be in Los Angeles.

Frank E. Greene was made marketing manager, airborne systems department, RCA Defense Electronics Products, Camden, N. J., Radio Corp. of America. He succeeds **Ralph S. La Montagne**, who became marketing manager of the new missile electronics and controls department, Burlington, Mass.

Robert H. Ebersole was made Detroit district sales manager, Federated Metals Div., American Smelting & Refining Co.

Charles M. George, secretary, was elected vice president and general manager-operations of the two plants of Gardner-Denver Co., Quincy, Ill. **Aubrey H. Jones**, vice president-export division, was elected president of Gardner-Denver International C. A., new subsidiary. **Kenneth J. McDaniel** was elected secretary.

Earl L. Wright was made manager, industrial supply department, Mine & Smelter Supply Co., at the Salt Lake City, Utah, branch. He succeeds **E. I. Lundstrom**.

John W. Touhy was promoted to assistant sales manager, Wilton Tool Mfg. Co. Inc., Schiller Park, Ill.

Chester A. Anderson was made assistant general manager, Bay City Foundry Co., Bay City, Mich. He was plant metallurgist at Baker-Perkins Inc.

Arvid Nelson was appointed assistant to the general manager at Hamilton Standard, a division of United Aircraft Corp., Windsor Locks, Conn. **Ermano Garaventa** succeeds Mr. Nelson as factory manager.

Carl J. Tylka was made director of technical service for Cooper Alloy Corp., Hillside, N. J.

Dr. Ruben F. Mettler was appointed executive vice president and general manager of the newly incorporated Space Technology Laboratories Inc., Los Angeles. He was vice president and assistant general manager of the laboratories, formerly a division of Ramo-Wooldridge Corp. STL is in charge of over-all scientific direction of the Air Force's ballistic missile program.

Edward N. Wrenshall fills the post of general manager, Kerotest Mfg. Co., Pittsburgh. He will direct and co-ordinate the steel and brass divisions of Valve Mfg. Co.

J. S. Urbanik was made manager of plant operations, electrical conductor division, Kaiser Aluminum & Chemical Corp., Newark, O. He is succeeded as manager of Newark plant by **W. E. Linne**.

Ernest A. Baker was made outside sales representative; **Howard Jones**, sales engineer-foundry and industrial coke and pig iron for England Coke Co. and Mystic Iron Works, sales subsidiaries of East Gas & Fuel Associates, Boston.

William H. Trout was appointed divisional controller of Carpenter Steel Co.'s Alloy Tube Div., Union, N. J.

Wallace J. Feasler was made sales manager, Molded Fiber Glass Co., Ashtabula, Ohio.

James A. Kelly was named manager of sales promotion, Buflovak Equipment Div., Buffalo, and Davenport Equipment Div., Mora, Minn., Blaw-Knox Co.

John Knarr was made government sales manager, Baker Industrial Trucks Div., Otis Elevator Co., Cleveland. He was senior development engineer, military products.

Western Rolling Mills Div., Yonkers Consolidated Industries Inc., named **for its new Tempe, Ariz., plant** **Palmer B. Ford**, sales manager. **R. A. Andrus**, general mill superintendent; **Joseph Ackerman**, mail

Turbine spiral case being fabricated of USS "T-1" Steel in the shop of the S. Morgan Smith Co., York, Pa. Plates ranged in thickness from $\frac{1}{2}$ " to $1\frac{1}{8}$ ".

Taming the mighty Snake River with turbine spiral cases of "T-1" Steel

Stronger steel reduces weight . . . cuts costs

Four of these huge spiral cases are being built for the Idaho Power Company for use in the Brownlee Dam on the Snake River near Robinette, Oregon. They are designed for a 250-foot head of water. The inlet is 18 feet in diameter and each turbine will generate 144,000 horsepower at a speed of 128.6 rpm. Water will flow through the cases at a rate of 5,460 cubic feet per second.

Because of the fierce pressure, it was obvious that a strong steel was required. USS "T-1" Steel was selected because it has a minimum yield strength of 100,000 psi. What's more, it can be fabricated, is readily weldable and has a high resistance to impact abrasion.

Cost savings. By using USS "T-1" Steel, there will be substantially less shipping weight across the country and less weld time and weld metal, both in the shop and on the job site. Had carbon steel been specified, double thicknesses would have been required.

Fabricating operations. Projection of the dimensional outline on the plates was done with Lumitrac. Plates were cut to size by flame-cutting and rolled cold to shape. Some parts were finish welded, others were tack welded and assembled. The

spiral case was then disassembled and shipped. Finish welding of segments is to be done at the dam site.

This job points up the economies possible with the use of USS "T-1" Steel. Why not use it for your own equipment? Write for our "T-1" book containing complete information. United States Steel Corporation, Room 2801, 525 William Penn Place, Pittsburgh 30, Pa.

Remember that we also make USS COR-TEN*, USS TRI-TEN* and USS MAN-TEN* Steels . . . widely used in power generation equipment.

HOWARD R. SILVERTHORN
Chrysler Marine & Engine mfg.

tenance superintendent; Eugene J. Schwetz, chief metallurgist.

Lester G. White was elected president of Alabama Metallurgical Corp., a new firm. Calumet & Hecla Inc. owns 70 per cent of its stock; Brooks & Perkins Inc. owns the balance. H. Y. Bassett, president of Calumet & Hecla, was named chairman and chief executive officer of the new firm, which has broken ground for a magnesium producing plant at Selma, Ala., scheduled to be in production by September, 1959. Other officers are: E. H. Perkins and D. W. Blend, vice presidents; A. E. Petermann, secretary; F. J. Gibbons, treasurer. H. Howard Perkins, president and chairman of Brooks & Perkins, is chairman of the executive committee.

Karl Gerteis was made manager, development engineering department, Unitary Equipment Div., Carrier Corp., Syracuse, N. Y. He was manager of the compressor development department. Maurice J. Wilson was made sales manager, commercial air conditioning, for the division.

E. L. Decker was made assistant chief engineer of Fuller Co., Catawauqua, Pa. He was supervisor of compressor engineering, and in charge of fan development. He succeeds Robert E. Metzger, now chief engineer of the Dracco Div. in Cleveland.

Alexander M. Beebee was made plant engineer, Rochester, N. Y., products division, General Motors Corp. He replaces Walter A. Scott, now senior engineer in the plant layout and methods department.

Ellis P. Hansen was appointed chief engineer, steam turbine department, Allis-Chalmers Mfg. Co., Milwaukee. He was assistant chief engineer.

Dr. F. C. Langenberg and G. E. Hutchinson were appointed material and process engineers by Crucible Steel Co. of America, Pittsburgh. Dr. Langenberg is responsible for standards of materials, processes, and measurements in primary steelmaking operations. Mr. Hutchinson sets up standards for measurement and analysis of product quality and yield.

Veet Industries, East Detroit, Mich., appointed Sidney E. Beach Michigan district sales manager of its Radial Drill Mfg. Div.

John P. Vaughn was made Los Angeles district sales manager, Voshan Mfg. Co., division of Pheoll Mfg. Co.

Ray M. Shaver was made assistant vice president in charge of freight car engineering for Pullman-Standard Car Mfg. Co., Chicago.

Richard A. Villacres was made western division sales manager for Huck Mfg. Co., Detroit. He replaces Ray V. Clute, now assistant to the vice president-sales.

Ray C. Joschko was named sales manager, Dixie-Merkle Cup Dispenser Div., Merkle-Korff Gear Co., Chicago. He was Minneapolis district manager of the company.

Charles Eric Ho was made assistant manager of market and economic analysis for Climax Molybdenum Co., division of American Metal Climax Inc., New York.

Howard R. Silverthorn was made director of manufacturing, Chrysler Marine & Industrial Engine Div., Chrysler Corp., Detroit. Howard D. Peacock was named chief engineer.

Fred O. Hosterman was promoted from executive vice president to director of sales to president and general manager, Weston Hydraulic Ltd., North Hollywood, Calif., subsidiary of Borg-Warner Corp. Fred succeeds I. E. Weston, now chairman and chief executive officer. Changes are effective Jan. 1. Arthur Shumate was promoted from vice president and assistant general manager to executive vice president-assistant general manager.

Joseph L. Sisto was made upstate New York district sales manager, Phoenix Iron & Steel Co., subsidiary of Barium Steel Corp. He has headquarters in Syracuse, N. Y.

Raytheon Mfg. Co., Waltham, Mass., promoted Albert E. Keleher to the new post of manager marketing planning, government relations, for the government equipment division. He is replaced by product sales manager, communications systems, for the division by Raymond Kendall.

T. C. Van Cise was appointed superintendent of plant protection at Republic Steel Corp.'s Youngstown steel plant. He succeeds W. E. Butler, retired.

OBITUARIES...

Roy W. Tompkins, 62, vice president-sales, U. S. Reduction Co., East Chicago, Ind., died Nov. 15.

E. B. Gleason, 55, president, Gleason Works, Rochester, N. Y., died Nov. 21.

George E. Gernon, 87, secretary, Gisholt Machine Co., Madison, Wis., died recently.

James H. Walsh, 80, former vice president, Inland Steel Co., died in Chicago Nov. 16.

Wheels coated with ALUNDUM abrasive give housing covers a high polish faster and for less money. Setting up the wheels, as shown, is an easy job. The high capillarity of this polishing grain improves and speeds up the wetting process with glue or cement.

Pay less for polishing...set your wheels up to save!

ALUNDUM* abrasive brings you the value-adding, cost-cutting "Touch of Gold"

Norton abrasives are first choice in many plants for better results at lower costs, in the widest range of polishing jobs.

Where especially long life is desired, the blocky shaped E₁ ALUNDUM B abrasive is extremely popular. Available in grit sizes 14 to 240. Where faster cutting action is required E₁₃₈ ALUNDUM S abrasive (sizes 14 to 90) or E₁₃₈ ALUNDUM R abrasive (sizes 100 to 240) are first choice. All three types are specially treated to give much greater adhesion with glue or cement. Typical advantages common to all ALUNDUM polishing grains include:

- *Uniform grain shapes*, which assure

fast, uniform cutting action.

- *Uniform grain sizings*, with no over-size grains that mar the finish, no undersize grains to loaf on the job.
- *High capillarity*, assuring the easy absorption of adhesive that means longer lasting, better performing set-up wheels.

The booklet "Setting Up Metal Polishing Wheels and Belts" contains valuable facts on the various types of ALUNDUM abrasive... on the applications of canvas, leather or wooden wheels... and on the best means of preparing wheels, with cement or glue. Ask your Norton Dis-

tributor for it. Or write to NORTON COMPANY, General Offices, Worcester 6, Mass. Plants and distributors around the world.

NEW

MILBAND BAND SAW MACHINE TOOL

For FASTER Cut-off Sawing at LOWER COST!

The all-new MILFORD MILBAND is the *first* band saw machine specifically designed, developed and constructed from the bottom up to give you the extra ruggedness, rigidity, variable speed range and other characteristics needed to handle high speed steel band saw blades with maximum efficiency. Built to withstand the heavy feeds and fast blade speeds of which high speed steel blades are capable, the MILBAND Machine takes continuous, heavy duty sawing in its stride without requiring frequent or costly maintenance. Here, in fact, is the machine you need to produce more . . . save more!

MILBAND gives you lowest cost-per-cut . . .

because you get more pieces per man-machine hour. Fully automatic bar feed permits a completely automatic stock feeding cycle. Narrower kerf with at least 50% less chip loss means big savings in material.

***MILBAND cuts consistently straighter,
smoother, more accurately . . .***

than other cut-off methods. This means less allowance for waste, less subsequent machining time to remove surplus metal.

WRITE NOW FOR COMPLETE INFORMATION . . .

Ask for your free copy of this circular that fully describes all the time- and money-saving advantages of the new MILBAND Machine . . . shows how this machine will help you reduce per-cut costs and cut metal faster and more efficiently than ever before. Remember, the sooner you put a MILBAND to work in your shop, the more you'll save . . . so act today!

Plans Plate Mill

Installation of 4 high, 112 in. reversing mill at Republic's Gadsden plant will start soon

REPUBLIC STEEL CORP., Cleveland, will install a new plate mill at its Gadsden, Ala., plant. Work on the 4 high, 112 in., reversing, hot rolling mill will get underway after the first of the year. It will replace a 3 high, 112 in. mill and will be installed closer to the hot-strip mill for more efficient operation.

• **Larger Slabs**—Skelp for pipe 24 to 30 in. in diameter will be rolled from slabs weighing up to 8000 lb—double the previous weight.

Slabs weighing up to 13,000 lb will also be rolled for finishing on the plant's 54 in. hot-strip mill. (They will be almost twice as heavy as those previously processed for the strip mill.) The new mill will be capable of rolling slabs up to 20,000 lb when new equipment is added.

In addition to the skelp and slabs for in-plant use, the new mill may produce some plates for the trade.

• **Auxiliary Equipment**—A set of vertical edgers will be installed about 13 ft from the entry side of the mill to assure closely controlled widths and provide minimum loss from side trim of skelp and strip. Twin electrical drive motors (each 5000 hp) will provide power for the mill.

Two electric furnaces, placed in operation a year ago, increased the plant's steelmaking capacity by 50 per cent (to 1.2 million tons annually). A major part of the steel processed at Gadsden goes through the plate mill since the pipe and strip mills which it serves are two of the heaviest tonnage users among the plant's finishing mills.

Makes Superston Castings

Columbian Bronze Corp., Freeport, N. Y., has been licensed by Superston Corp. to make marine propellers and other castings in Superston, a bronze alloy (nominally 12 per cent manganese, 8 per cent aluminum, 3 per cent iron, 2 to 6 per cent nickel, and the remainder

copper). Superston Corp. was formed recently by J. Stone & Co. Ltd. of England (developer of the alloy), Ampco Metal Inc., Milwaukee, and American Brake Shoe Co., New York.

Consolidates Purchasing

American Steel & Wire Div., including the Cyclone Fence Dept., U. S. Steel Corp., has closed purchasing offices in Chicago, North Chicago, Ill., and Worcester, Mass. The division has consolidated all buying in the Cleveland headquarters office, but will have a purchasing representative at Worcester to buy production materials used in making electrical wire and cable. R. W. Berrett is director of purchases.

Aluminum Mill Readied

Reynolds Metals Co., Richmond, Va., is preparing to start operation of a new 66-in. bright mill at its Sheffield, Ala., plant. The 2-high, single stand mill was designed and built by E. W. Bliss Co., Canton, Ohio, for high speed cold rolling of aluminum sheet. With a maximum speed of 1000 fpm the mill can reduce sheet thickness about 50 per cent. It can handle gages from 0.10 in. down to 0.006 in. Maximum strip input is 63 in.

Installation of the mill is part of the plant's \$65 million modernization and expansion program, says G. L. Simms, general manager of Reynolds' Sheet Div. The program includes installation of a 170-in. hot rolling mill which is expected to be in operation in about a year. Another well-advanced phase of the program is the installation of heavy presses for blanking operations.

Buys Cogsdill Drill

Cogsdill Twist Drill Co. Inc., Oak Park, Mich., sold its drillmaking facilities to Cogsdill Twist Drill Co., a new subsidiary of Sheffield Corp., Dayton, Ohio. Sheffield is a subsidiary of Bendix Aviation Corp., Detroit. Sales and manufacturing operations have been transferred to Greenfield, Mass. Officials of the new company include Thomas Clark, president, and Roy Heldenbrand, general manager of the plant.

Birdsboro Converts Mill

Birdsboro Steel Foundry & Machine Co., Birdsboro, Pa., modernized its roll stands in a continuous mill. Northwestern Steel & Wire Co., Sterling, Ill. The conversion permits the rolling of universal beams and is the first installation, Birdsboro officials say, where wide flange beams are rolled on a continuous mill. The new universal stands were rebuilt from existing horizontal, 2-high stands. The converted mill can be used to produce other carbon steel forms, such as angles, channels, and plates on switching stands.

Olin Mathieson Builds

A metallurgical research center for Olin Mathieson Chemical Corp., New York, that combines laboratories and an integrated production plant will be completed at New Haven, Conn., by mid-1959. Estimated cost: \$4 million.

Snyder Tool Changes Name

Snyder Tool & Engineering Co., Detroit, changed its name to Snyder Corp. The machine tool builder made the change to avoid confusing the company with tool and die manufacturers.

Geo-Drill Co. Formed

Geo-Drill Co. has been organized at Bridgeville, Pa., by James Barrett. The firm will manufacture a portable diamond core drill and associated bits for drilling close tolerance holes through reinforced concrete and masonry structures.

Loftus To Build Plant

Loftus Engineering Corp., Pittsburgh, has been awarded a contract to provide all engineering and construction supervision for the open hearth portion of a new Argentine steel mill costing about \$475 million. The contract was awarded by the government of Argentina on the approval of Armco International Corp., acting as consultant on the project.

The new mill, Sociedad Mixta Metalurgia Argentina, will be located at San Nicolas. It will have an annual capacity of 750,000 metric

ons. Products will include structurals, mold shapes, rolled sheets, and tubes. The steel mill will contain four open hearth furnaces. Capacity of each: 250 metric tons.

Forms Tank Terminals Inc.

Buckeye Pipe Line Co., Cleveland, and Chicago Bridge & Iron Co., Chicago, organized a jointly owned company, Buckeye Tank Terminals Inc., 30 Broad St., New York, N. Y. The firm will construct, own, and operate terminal tankage and will lease the facilities.

Modernizes Skelp Mill

Laclede Steel Corp., St. Louis, awarded a contract to United Engineering & Foundry Co., Pittsburgh, for rebuilding and modernizing the 10-in. skelp mill at its Alton, Ill., plant. New equipment will include billet handling equipment at the entry side of the furnace, five roughing mills, a down and upcut shear, two edgers, and strip handling conveyors and rolls. Upon completion next fall, the mill will be capable of producing skelp up to 16 in. in width and will have greatly increased capacity.

NEW ADDRESSES

Thor Power Tool Co. moved its executive offices to 175 N. State St., Aurora, Ill.

Raybestos-Manhattan Inc., Passaic, N. J., moved its district warehouse and offices to larger quarters at 168 Beacon St., South San Francisco, Calif.

McDermott & Green (industrial equipment) moved to a new plant at 3429 Olympic Blvd., Los Angeles, Calif. Equipment includes forming and welding machines.

Abar Metals & Supply Co. moved to 1000 E. Slauson Ave., Los Angeles, Calif.

Spaulding Metals Co. Inc. established a new plant and administrative offices in Industrial Park, Syracuse, N. Y. Services of the company include hot tinning and production of metal castings.

CONSOLIDATIONS

Thomas Industries Inc., Louisville, will purchase Benjamin Electric Mfg. Co., Des Plaines, Ill., subject to approval of stockholders. The firms make lighting equipment.

J. M. Nash Inc., Milwaukee, purchased Bell Machine Co., Oshkosh, Wis., and will operate it as a subsidiary. E. J. Bell will remain as president and E. Paul Bell as vice president of the Oshkosh firm. Both companies make machinery.

Misco Fabricators Inc., Marysville, Mich., merged with Berlin Chapman Co., Berlin, Wis. Misco is a division of Consolidated Foundries & Mfg. Corp., Chicago. Production of high alloy weldments, fabrications, and heat resistant fixtures will continue at the Marysville plant.

NEW PLANTS

Ontario Culvert & Metal Products Ltd. has completed a plant for production of steel culverts at Waterloo, Ont.

Textron Metals Co., Girard, Ohio, opened a 45,000 sq ft plant at 1025 W. North Ave., Chicago. The firm makes home aluminum equipment.

Johns-Manville Corp., New York, has put its South Chicago, Ill., plant into operation. It is the seventh new factory the firm has built this year. It is operated by the Dutch Brand Div. for production of pressure sensitive tapes, adhesives, and related rubber products.

Bucyrus-Erie of Canada Ltd. officially opened its plant at Guelph, Ont. The firm, a subsidiary of Bucyrus-Erie Co., South Milwaukee, Wis., makes cranes and excavators.

Ultra-Sonic DeBurring Co., New Hyde Park, N. Y., opened a branch plant at 2300 Morris Ave., Union, N. J. The plant is equipped to remove microscopic and larger burrs

from metal parts and to round edges to any measurable radius and tolerance.

Fisher Scientific Co., Pittsburgh, plans to open its 115,000 sq ft plant at Indiana, Pa., on Dec. 1. The facility will be operated by its Instrument Mfg. Div.

ASSOCIATIONS

Plumbing Brass Institute, Pittsburgh, elected these officers: President, John H. Pimm, Bridgeport Brass Co., Bridgeport, Conn.; first vice president, Roger Milroy, Lee Bros. Foundry Co. Inc., Anniston, Ala.; second vice president, M. W. Peterman, Milwaukee Faucets Inc., Milwaukee; and treasurer, Nate Cohn, Dearborn Brass Co., Cedar Rapids, Iowa. Hanson & Shea Inc., Pittsburgh, was renamed executive secretary.

National Tool & Die Manufacturers Association, Cleveland, elected these officers: President, Jack Kleindorfer, Vidmar Inc., Williamsport, Pa., and Volkert Stampings Inc., Queens Village, N. Y.; first vice president, J. A. Barth, Barth Corp., Cleveland; second vice president, H. G. Murdock, Arrowsmith Tool & Die Corp., Los Angeles; secretary, John Dewhurst, Arrow Tool Co., Wethersfield, Conn.; and treasurer, J. A. Perdy, Atlantic Mfg. Co., Philadelphia.

National Association of Aluminum Distributors, Philadelphia, elected these officers: President, Carl S. Vogel, Edgcomb Steel Co., Philadelphia; treasurer, Pollard Turman, J. M. Tull Metal & Supply Co. Inc., Atlanta; and vice presidents, G. D. Potter, Corey Steel Co., Chicago, and C. C. Carmichael, Copper & Brass Sales Inc., Detroit.

Caster & Floor Truck Manufacturers' Association, Chicago, elected these officers: President, W. R. Thomas, Thomas Truck & Caster Co., Keokuk, Iowa; vice president, L. T. Williams, Bond Foundry & Machine Co., Manheim, Pa.; treasurer, D. B. Anderson, Nagel Chase Mfg. Co., Chicago; and executive secretary, H. P. Dolan.

forward with forgings. **75 years!**

The steel plowshare was the basic agricultural tool when Wyman-Gordon was established seventy-five years ago. At that time, it took approximately 50 per cent of the nation's work force on farms to produce food for our country's needs.

With today's mechanical farm implements, it requires only 12½ per cent to feed our people. The development of modern farm implements, motor cars, trucks and tractors, railroad locomotives, and the "Mach era" aircraft and space vehicles, would have been impossible without forgings.

Whenever the ultimate is required in power, speed, endurance or reliability there is no substitute for a forging. Today, as for seventy-five years, Wyman-Gordon continues in the forefront in new forging developments.

December 1, 1958

Outlook

VISION FOR TOMORROW—The next decade will see great progress in applying ultrasonics to metalworking, says J. Byron Jones who heads up Aeroprojects Inc., West Chester, Pa., one of the country's leading research firms. Look for: 1. Solutions to difficult alloying problems. (Refractory elements can be quickly and easily dispersed in an ingot during solidification.) 2. Better results in the various squeeze forming methods. (Ultrasonic energy applied to a punch eases metal flow, or improves finish, or reduces power need.) 3. Faster machining with single point tools. (A lathe turns easier or faster when the tool is attached to a "force-insensitive" mounting coupled with an ultrasonic generator.)

CAST PLASTIC THREADS— A west coast manufacturer makes threaded caps for lead screws this way: He drills a hole through the diameter of a steel tube that is large enough to accept the screw. Coated with a parting agent, the screw is inserted, and an epoxy plastic poured around it. When hard, the screw is twisted out leaving a perfectly threaded cap. Next question: Why not cast a lead screw with a nut as a mold?

WIGGLE CUSHIONING—Next time you move equipment, don't overlook flexible machine mounts. They're gaining greatly over the traditional floor bolting techniques. Some firms claim maintenance costs are reduced (Leeds & Northrup, North Wales, Pa., is one proponent). Other plusses include higher quality work put out by the machines, less installation time.

BOW AT DOW—You can put a clear anodic coating on magnesium in less than a minute with a new process developed by Dow Chemical Co., Midland, Mich. A top coat of lacquer or varnish increases corrosion protection.

INDEPENDENCE IN AUTOMATION—One of the things to guard against in long, automated lines is the dependence of the whole line on each station. You must be sure that if one station shuts down, the whole line doesn't have to fol-

low suit. Cross Co., Detroit, got around the problem with a new palletized machine built in a rectangle. One long side handles rough and semifinished machining operations on a gear housing. The other long side has two sections, one for finish boring, the other for gaging. Conveyors connect the three sections and each operates as fast as material comes to it. Any section can be stopped without shutting down the other two.

LESSENS BATH STEAM—Amchem Products Inc., Ambler, Pa., has a fluid which acts as a blanket over some liquid baths. It cuts down steaming (and the resultant heat loss) but doesn't interfere with chemistry. Some highly beneficial results are showing up in certain pickling installations, among which are reduced structural corrosion and improved working conditions.

MAKE YOUR OWN SALES FILMS—It's no problem to keep your salesmen, customers, or prospects informed of improvements in your product when you use do-it-yourself movies. Oster Mfg. Co., Cleveland, makes 16 mm sound films, gets several prints, and even dubs in Spanish, Dutch, French for its export department.

MISSILE MUSCLE—Uncle Sam has less and less faith in aircraft, says Cornell Aeronautical Laboratory, Ithaca, N. Y. Its transonic wind tunnel experience during 1958 dramatizes the shift. More work will go to Army and Navy missile projects in 1959, say university experts.

TITANIUM PROGRESS—Titanium Metals Corp. of America shipped a 3000-ft coil of 0.002-in. titanium foil to a honeycomb maker. Significance, say observers, is that such alloys can now be rolled on existing mill equipment and designers will be able to use annealed titanium. It eliminates the need for heat treated alloys to match the 200,000 psi compressive strength level and lightness of titanium.

[illegible]

In cross extrusion, the wire leaves the die at 90 degrees to the direction of applied force. Additional breakup of directional flow lines improves mechanical properties

Spring Wire Gets a Lift

Produced by cross extrusion, it shows a substantial increase in service life. Developers of process see it used to make other specialty items for crucial applications

CROSS EXTRUSION of spring wire may be the answer to longer life for springs, particularly those used on aircraft valves.

Engineers at Curtiss-Wright Corp., Buffalo, who are developing the method, believe that it brings the longitudinal and transverse properties of the wire closer together. Another advantage they cite is maximum internal working of the metal.

The first springs produced from

cross-extruded wire (SAE 6150 chromium-vanadium alloy steel) passed initial 150-hour tests. Complete confirmation of the method will depend on a long range service test in progress. The springs have been in operating aircraft for six months, and not one has failed.

In other applications on tests, preliminary results indicate an amazing increase in spring life, states John F. Murphy, chief production engineer at Curtiss-Wright.

• **Principle Behind It**—Cross extrusion is similar to forward extrusion, except the wire leaves the die at 90 degrees to the direction of the applied force. The additional breakup of the normal directional flow lines improves mechanical properties.

A reduction ratio of 100 to 1 is used to extrude the billet. Length of the billets depends on the speed and tonnage of the press, and the hot working characteristic of the materials.

• **Equipment in Use** — Curtiss-Wright uses a 1000-ton vertical press for experimental production. Tooling is designed for maximum

To demonstrate metal flow in cross extrusion, Curtiss-Wright engineers drilled longitudinal holes in a brass billet and inserted copper rods. Then the billet was cross extruded. The photos above are halves of the unextruded butt (turned on their sides). The protrusion in each curve is the end of one

of the rods. The remainder of the rod is indicated by the flow lines converging toward the top of the photo. It shows the flow of metal to the die opening. The hemispherical end on the billet was one type of arrangement that has been used as the bottom of the container

strength and rigidity, so it can handle the anticipated stress level of 160,000 psi.

Dies are made of cast Rexalloy which has a hard, wear-resistant surface and the strength necessary to withstand the high container pressures. Thermostatically controlled gas burners heat the container. A coiler attached to the outlet of the press makes handling of the extruded wire easier.

• **Wire Specifications**—The wire produced is 0.410 in. in diameter. Tolerances are plus or minus 0.007 in. Ovality is within 0.015 in., and the finish is about the same as hot-rolled standards. Depth of decarburization measures less than 0.001 in.

Mechanical properties are im-

proved. Impact strength increases 128 per cent in the transverse and 110 in the longitudinal direction. Transverse elongation improves 38 per cent and longitudinal is up 11 per cent.

• **Future Looks Good** — Several factors encourage the development of the process. Tool costs are low. A low grade of material may be cross extruded to make a product that is equal to or better than a forged or rolled product.

Several phases of the process must be improved before it is competitive with other mass production methods. For example, the billet is now placed in the press with tongs.

When the process is refined, other parts may be produced. Tests

indicate that the tool life of cross extruded tool steel is 50 per cent longer than that of conventionally processed material.

• **Many Materials Adaptable**—Other materials have been cross extruded to determine technical and economic feasibility. Some of these are SAE 4130, 300 series stainless, 400 series stainless, high speed steels, copper, brass, bronze, aluminum, and titanium.

In general, the process is too costly for many applications where conventionally produced stock is satisfactory. But many specialized alloy applications look promising. Mr. Murphy explains: "It will serve as a high quality specialty item, giving designers a better material for crucial applications."

Direct Labor Costs Cropped 54% by Integrated Cupola Charging

OLD METHOD

Hourly Direct Labor Cost

CHARGE DECK	\$6.00
Four men at \$1.65 an hour each	
CRANE OPERATOR	1.00
CRANE HELPER (half time)	0.50
Total	\$7.50

Direct Labor Cost per Ton \$0.625
At 12 tons an hour

NEW METHOD

Hourly Direct Labor Cost

CHARGE DECK	\$1.00
One man automatically loads coke and limestone and runs cupola charge crane.	
CRANE OPERATOR	1.00
CRANE HELPER (half time)	0.50
Total	\$2.50

Direct Labor Cost per Ton \$0.208
At 12 tons an hour

An investment of \$27,550 is recovered in the first three years. This article, which shows how aggressive cost cutting can pay off, is one of the top entries in the Cost Crisis Awards Competition. Another will appear in next week's issue

MOST cost cutters figure that all hand production operations are open to suspicion. In the drive to boost the productivity of high-cost labor, mechanization of the "muscle" jobs often makes a good starting point.

That's the way it worked at Gen-

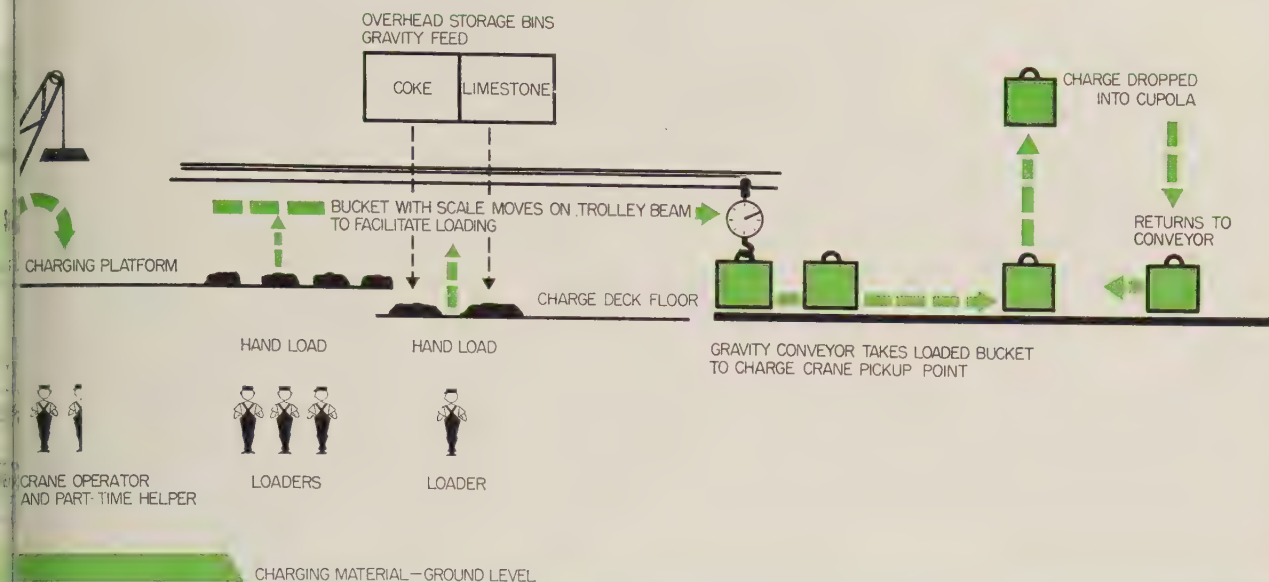

eral Foundry & Mfg. Co., Flint, Mich., where plant engineers used a touch of automation in cupola charging. It had these results: 1. Saved 41 cents direct labor cost on every ton of iron melted. 2. Boosted the quality of the pour. 3. Raised the melting capacity of the

line. 4. Improved safety and working conditions.

Here's how they did it:

- **Old Way**—All charges were man up in drop-bottom buckets on the charge deck of the cupola. A locomotive crane in the yard kept the charge deck bins supplied with material—filling them during the off shift and replenishing as necessary during the charging shift.

On the charge deck, buckets hung on portable scales suspended from a monorail. As the buckets

were hauled past the material bins, workmen loaded them by hand. To maintain any melt rate over 10 tons an hour, the system required four men on the deck, a crane operator, and a part-time helper.

New Way — The charging machine operator now releases an empty bucket (by remote control) to roll down a conveyor to a turntable. When the bucket is on the turntable, the crane operator loads metal through a charging cone that acts as a funnel. The operator

watches a large scale dial to get the right amount of stock in each bucket.

When metal loading has been completed, the charging machine operator releases the bucket to a roller conveyor that takes it to a second loading station. There he feeds coke or limestone from overhead bins via conveyor belts. He can control the amount of each material that goes in by watching a scale dial. He also can load small quantity items like spiegeleisen and briquettes.

Next, he lets the bucket roll to a pickup point where he hooks it to the monorail charger. He also has complete control of the charging cycle, including the return of the empty bucket to the starting point.

W. Arthur Coakes, plant engineer, tells STEEL the charging system operator, the crane operator, and a part-time helper maintain a higher, more accurate melting rate with the integrated cupola charging system than was possible with the old method.

A large cast steel platen represents the successful use of good casting techniques

Casting Tears Slashed

This firm reviewed and applied known corrective foundry practices when welding time per piece rose to 50 hours. Result: Repairs plummeted to 1 hour per unit

IN THE production of eighteen 27,000-lb press platens, 50 welding hours were spent on each of the first three castings. The last six took little more than 1 hour each.

How was it done? Through review and use of known corrective procedures for the reduction of hot tears in susceptible, large steel castings. Five advanced techniques that are practical for any foundry were put to work:

1. Sand that absorbs expansion.
2. Multiple gating of correct thickness.
3. External 1 x 6 in. chills.
4. Favorable design.
5. The most favorable carbon content in the metal.

National Supply Co., Torrance, Calif., was responsible for casting design of the 18 ft long, 7 ft wide, 22 in. deep (at the center) piece. The ribs were 1 in. thick and the

bottom plate 13¼ in., allowing ¾ in. for finishing.

The job was an entire core assembly with 20 large cores set in a pit. With platens produced in lots of six, the cores were set on a concrete slab tilted about 10 degrees for pouring.

The gate was placed down and the casting poured uphill to avoid covering the entire drag with metal as it entered. This protected the cope from spalling.

• **Cooler Pouring Helps**—Pouring temperature was originally 2950° F, but satisfactory results were obtained at 2850° F. Experience with large castings has indicated that the cooler the pour, the less cracking takes place. Lower temperature also prevents the sand from burning in.

Large cracks at all ribs of the first casting resulted from the use of 12 per cent silica flour sand in

the casting pockets (backed with wood flour, a cellulose material). The cracks were reduced by using sand with wood flour only.

Large cores are often overrodded in an attempt to prevent core breakage. But core rods and gags in the cope promote cracks because of expansion. This amounts to in. per foot at 1200° F.

Gate thickness in relation to casting contact thickness is important. When a gate is thicker, the casting usually has cracks at contact. Cracks are also caused by a concentration of heat at the gates. Increasing the contacts from one to two (on a large piece) to eight, heat is spread.

The gate may have to be repositioned to reduce concentration of hot metal. Cracks were eliminated on the National job by placing 6 in. diameter chills 6 in. long at the corners on the gate side.

• **Most Effective of All**—Increasing the carbon content of the steel from 0.23 to 0.40 effected the most marked change. Welding time per casting was about 20 hours before this change was made. The first piece poured with the new steel had no cracks.

In making the last six castings with higher carbon steel, total welding time was 7¾ hours (three required no welding). Most of the time was spent where a head was cut low.

New Alloy Weldable

needs no heat treatment to prevent cracking. Useful for continuous service to 1200° F

WELDING problems with metals that are useful for highly stressed parts at elevated temperatures may be solved by a new air-hardening, fully martensitic alloy.

Known as Carpenter 404 alloy, the material is designed to be free from weld cracking without preheating or postheating. Weldments can be readily cold worked after stress relieving or annealing.

Applications—The steel was developed by Carpenter Steel Co., Reading, Pa. It is recommended for uses such as steam turbine buckets, blades, and bucket covers, as well as for "casting in" assemblies like turbine diaphragms.

The material is a 12 per cent chromium, 1.5 per cent nickel composition that has relatively high tensile strength and good ductility. Carpenter says it shows a marked improvement in weldability over Type 410 stainless, and a more uniform structure and higher hardness than Type 405.

In the annealed condition, the steel is easily blanked, drawn, formed, or cold headed. Another advantage cited by Carpenter is easy machinability in both the treated and annealed conditions.

Resists Corrosion—The metal resists a wide range of corrosives, including the atmosphere, fresh water, mine water, steam, carbonic acid, crude oil, gasoline, perspiration, alcohol, ammonia, mercury, soap, sugar solution, and other reagents. It has good resistance to scaling at elevated temperature and can be used for continuous service to 1200° F.

The alloy is made by the company's Mel-Trol process, a quality control system with patented ingot design. Mel-Trol is used to minimize the causes of inconsistent center line quality which often causes erratic service in alloys of this type.

Carpenter 404 is available in forging billets; hot rolled bars and forgings, annealed or heat treated; cold drawn and ground bars; wire and wire rods; and strip, annealed or tempered.

Plastic is easily stripped from metal parts and then melted for re-use

Plastic Masking Aids Platers

A well-tested work horse in the protective coating field is effectively trimming the cost of preparing metal parts for bath. It's fast drying and easy to remove

PLATING TIME and labor costs have been substantially reduced by substituting a butyrate peelable plastic for conventional lacquers: The plastic dries quickly, can be removed easily.

Parts are dipped into the molten plastic, which solidifies within a minute after the parts are removed. After plating, the plastic is peeled off for re-use.

A two-step job carried out by United Platers Inc., Detroit, involved selective plating of an aircraft wing control lever. Specifications called for complete cadmium plating except for six bearing surfaces (these were to be lead plated).

The bearing holes were plugged

with the composition. After plating with cadmium, the plugs were removed and the entire part was dipped into the plastic. The bearing holes were then trimmed and the part was immersed into the lead plating bath.

The coating, called Seal-Stop was developed for plating by Seal-Peel Inc., Royal Oak, Mich. Butyrate is supplied by Eastman Chemical Products Inc., subsidiary of Eastman Kodak Co., Kingsport, Tenn. It is nonexuding, does not contaminate the plating solution, and does not leave any residue.

Other uses include protective packaging, used as a potting compound, and as a mask in painting.

Fixture is in position with hood over rear axle housing which turns as weld is made. Cams guide the arc over a noncircular route. One operator runs two machines like this one

Automaker Welds at 150 ipm

Process features hollow electrode which holds flux. It is faster than submerged arc and improves quality of high speed welding needed in auto production

AUTOMAKERS are getting 150 ipm welding speeds from a machine that joins dust caps to rear axle housings in about 14 seconds.

The process (Lincoln Electric's Innershield) uses a flux-filled electrode that works exceptionally well on light gage steel.

• **Part Thicknesses**—The dust cap is joined to the axle housing with a weld that is 33 in. long. The cap is about 0.090 in. thick; the housing is 0.25 in. thick.

The submerged arc method was previously used. Conversion required replacement of the head, controls, and a motor-generator which supplies an output more suited to the process. Turntable speed was increased and a hood added to protect the operator.

• **Operation**—Housings arrive by conveyor. The operator loads the

part onto the fixture, inserts a dust cap, and lowers the head and hood over the work. The arc starts automatically.

The head follows the noncircular seam through a cam arrangement as the table turns. The completed part moves to the unloading position at the machine front after the head and hood retract.

During operation, some of the ingredients in the electrode vaporize on contact and provide a shield that protects the arc. Other components flux and deoxidize the weld. The process doesn't require any other gas or flux.

One auto firm has six machines. Each operator runs two.

The welding process also joins flanges to the housing and lays a reinforcing bead on the inside of the seams which run the length of the axle.

Sketches Cut Work Time

By adding detail sketches to work routing orders, Baker Perkins Inc., Saginaw, Mich., has been able to halve the time required for layout, drilling and tapping on large sheet and structural metalwork.

Under the old system, a complete blueprint accompanied each order through the plant. The workmen had to pore over the prints to determine the particular operations they were supposed to perform. That added working time and sometimes resulted in errors because they were not familiar with all the changes and specifications on the printed sheets.

Now, each man can see quickly what operation he is to do.

Since many of the initial operations are routine, and are repeated many times with only minor variations, Baker Perkins has printed a series of sketches for such items as angles, channels, and I-beams. On the initial job routing sheets, the specifications and information are printed on the sketches which are attached to the work orders as they go out into the plant.

Aluminum in New Market

Development of distributed transformer housing made easy from aluminum extrusions represents a breakthrough into a new market for the light metal that it totals 25 million lb a year.

Reynolds Metals Co., Richmond, Va., which has pioneered other profitable markets for aluminum, says the tanks weigh one-third less than their steel equivalents. Officials point out that the lightweight will make installation of transformers on poles easier, safer, and more economical.

The extruded sectors, which have readymade fins for dissipating heat, are applicable to 25 kva and larger transformer sizes. The extrusions have lifting lugs, hanger attachments, and core and coil supports.

Reynolds also claims economy in maintenance costs as well as in manufacture. The total savings offered in fabrication and use of the aluminum housings will bring overall costs in line with those of conventional steel housings, the company says.

ALCO steel, made in small heats to exact metallurgical specifications, is your assurance of high-quality forgings.

ALCO's regular forgings offer many opportunities for cost reduction in machine set-up and tooling.

HOW ALCO FORGINGS HELP LOWER COSTS

Forgings from ALCO are controlled during every step of production to assure uniformity and conformance to your specifications.

In either regular or Hi-Qua-Led® grades in any AISI specification, or in stainless steel, ALCO circular and open-die forgings offer you unique advantages. They can lower your costs in machine set-up and tooling, because you are able to standardize procedures and set machining speeds for the best overall economy. Yet this extra oppor-

tunity for profit is obtained with no additional expense.

ALCO's forged and rolled circular forgings range from 18 to 145 in. OD; open-die forgings from 500 to 30,000 lb and 40 ft in length; mandrelled ring forgings to approximately 60 in. wide.

Your inquiries will receive prompt processing. For more information, contact your nearest ALCO sales office, or write ALCO Products, Inc., Department 157, Schenectady, New York.

HyL sponge iron plant at Fierro Esponja, Monterrey, Mexico. Gas reforming furnaces are at left, reactors in the center, and ore loading hopper and conveyor system at right

Here's Direct Reduction Process for Small Plants

It offers specialty steel producers a means of integrating production without an enormous investment. Ore is changed to sponge iron by reacting it with a reducing gas

DIRECT REDUCTION of iron ore to sponge iron that can be charged into an electric steelmaking furnace is now commercially practical. Developed by Hojalata y Lamina S. A., one of Mexico's principal steel producers, with engineering assistance from the M. W. Kellogg Co., New York, the process has been proved in production at a 200 ton-per-day plant operated by Fierro Esponja S. A., Monterrey, Mexico.

- **Significance**—The HyL process offers specialty steel producers a means of integrating production facilities without building a blast furnace. It also may be a boon for areas which have rich deposits of ore but lack abundant coking coals or limestone. The facility (reducing atmosphere equipment and reactors that make the sponge iron) doesn't take

as much of a capital investment as a conventional steel plant, and can be built on a smaller scale. Ores with a high percentage of fines (difficult to handle in normal blast furnace operation) may be reduced to metallic iron and then quenched, then sold as high quality metallic feed.

- **Reduced with Gas**—In the Fierro Esponja plant, Durango hematite ore is reduced in fixed bed, batch type reactors by direct gaseous reduction. Average ore analysis (percentage by weight):

Insoluble	4.2
Iron	66.0
Phosphorus	0.0
Sulfur	0.0

The sponge iron is charged directly into electric furnaces in place of pig iron or scrap. (The Mexican steelmaker says the steel is highest quality.) One analysis of reactor-produced sponge iron:

Continuous galvanizing lines

THREE MESTA 48" CONTINUOUS
GALVANIZING LINES WITH FEED

FLYING SHEARS WITH LEVELLERS.

Designed and Built by
MESTA

Designers and Builders of Complete Steel Plants

MESTA MACHINE COMPANY

PITTSBURGH, PENNSYLVANIA

One of the five reactors, each of which holds 30,000 lb of ore. After the ore has been reduced, the reactor is dumped

Metallic iron	86.000
Total iron	90.000
Per cent reduction	95.550
Carbon	0.620
(can be increased to 2%)	
Sulfur	0.070
Insoluble	8.000

The reducing atmosphere is about 85 per cent hydrogen and carbon monoxide. (Remainder is carbon dioxide, methane, and water vapor.) It is obtained from natural gas which is desulfurized, then passed through a Kellogg, high-pressure-steam reforming furnace. The reducing atmosphere also can be made from petroleum.

• **Reaction Cycle 4 Hours**—Five reactors using the HyL process are in operation. The reaction cycle requires 4 hours with an additional 30 minutes for dumping and charging.

At any moment, each reactor is at a different stage in the cycle, making it possible for one labor crew to operate the facility. A reactor is dumped every hour.

• **Reactor Charge**—Ore $\frac{1}{4}$ to $1\frac{1}{2}$ in. in size is charged into the reac-

tors. In the 200 ton-per-day plant, each reactor holds about 30,000 lb of ore. About 21,000 cu ft of natural gas are required per ton of reduced ore.

Final ore reduction takes place within a range of 1600 to 1900° F. The reduced product retains the approximate size of the charged ore but becomes porous. The hot sponge is discharged from a reactor to a hopper for transportation to a melting furnace.

Of the total product charged into the reactors, about 85 per cent is discharged as metallic iron, representing removal of 90 per cent of the oxygen in the ore.

• **Larger Plant Planned** — The Kellogg company, a subsidiary of Pullman Inc., is the world-wide and exclusive sales and licensing agent for the HyL process. It did much of the engineering on the present plant, and it will engineer and build a second plant for Fierro Esponja with a 500 ton-per-day capacity.

The larger plant will have substantially lower utility requirements, improved thermal efficiency,

and improved operating economy, say Kellogg engineers. Improvements in the mechanics of operation which greatly simplify material handling will be incorporated in the larger plant.

Kellogg's estimates of utility needs:

Natural gas required	
cfh	353
cf/ton of iron	16
Net steam make	
lb/hour	2
lb/ton of iron	
Circulating cooling water	
gallons/minute	4
gallons/ton of iron	12
Electricity	
kw-hr	
kw-hr/ton of iron	
Capital investment	
dollars/annual ton of iron (based on Gulf Coast plant site)	

• **Future Looks Good**—Far larger plants are practical. Here's estimate of operating costs for 1000 ton-per-day plant (dollars per ton of iron) in the Gulf Coast area:

Iron ore (1.76 tons @ 58% Fe) ..	24
Gaseous reducing media	2
Fuel	1
Water	1
Steam	1
Boiler feed water	1
Power	1
Steam credit	-1
Fuel credit	-1
Labor	0
Total production cost	29
Maintenance and capital charged at 20% of plant cost	5
TOTAL	34

In the new 500 ton-per-day plant, five reforming furnaces will supply the reducing gas. Reduction will take place in four reactors, each of which will hold about 105 tons of ore. The plant will be engineered to utilize the heat content of the reformed gas and the reduced ore.

The sponge iron will be cooled after reduction. That will bring about additional saving by eliminating the need for special equipment and procedures to handle metals at high temperatures.

When ready for discharge from the reactors, the iron can be sent directly to the electric furnaces or can be stored for later shipment to steel plants. Reoxidation of the sponge iron is no problem.

BROWNHOIST TOWER

unloads 540 tons of coal

per hour!

Designed and built to unload coal from barges to a power plant on the Ohio River, this Industrial Brownhoist stationary tower crane achieves a production rate of 540 tons per hour! Barge hauls move barges to proper location underneath unloader and coal is transferred to 100 ton bin built into the tower and then fed on to a belt conveyor to the plant. All motions are controlled by operator from one position in operator's house which is pressurized with clean air provided by a blower.

The tower, with a 6-ton rope system, is fixed to a concrete cell

and is of all-welded construction. Erection joints are fastened with high strength bolts. A pillar crane is fixed to the tower to service electrical and machinery parts in the machinery house.

Industrial Brownhoist designs and builds specialized equipment like this tower in any tonnage and capacity for handling any material at sea ports, steel mills, ore and coal docks and railroad yards throughout the world. For more information on reliable high speed, high capacity material handling equipment, write for catalog 562.

OLD WAY: Tool stretches, cracks cleat rim

NEW WAY: Tool confines cleat rim to small area, prevents cracking

Modified Cleating Tool Trims Cost

A simple change in profile reduces stretching and prevents cracking at the rim of the cleat. Savings result from elimination of heat treatment and extra machining

CLEATING by an improved method, using a newly designed tool, promises greater strength and better appearance in metal-to-metal joints.

Developed in the radio factory of Philips Incandescent Lamp Co., Eindhoven, Netherlands, the method eliminates cracks in the rim of the cleat from severe deformation, H. E. Deelman reports in the *Philips Technical Review*.

The new tool holds the rim closer to the center. That reduces

the degree of deformation or stretching around the outer rim when the tool is applied. A thicker rim also improves the strength and appearance of cleated joints.

• **Two Cleating Methods**—In two conventional methods, the cylindrical end of the cleat is pushed through a hole in one or more metal plates, then forced outward with a special tool. In one method, the tool presses downward on the entire circumference of the cleat rim at one time; in the other, a

spinning tool, which contacts only two points on the cleat rim at one time, is used.

Cleats made from steel, brass, or aluminum bars machine better after hardening.

When those metals are hardened by cold working, ductility is reduced and the rim tends to crack when it is stretched.

• **Annealing Costly** — To prevent cracking with conventional tools, cleats can be annealed. (Some deformation occurs and the cleat must be machined or ground to assure proper fit.) The cost of annealing and extra machining make the cleating operation an expensive one.

large cast steel gears to your designs and specifications

by **AVONDALE**

Avondale's Service Foundry Division manufactures cast steel gears (plain or alloyed) to 15' diameter and 30" face. Gear teeth are cut without limitation to tooth form or size on Service Foundry's large Gleason gear planer. Cast tooth gears are also manufactured regularly. For your next gear order, consult Service Foundry NOW! Write for our illustrated brochure, *Foundry Work—Steels, Alloys & Non-Ferrous, Vol. 6.*

Top-Hat Quality IN Perforated Metal

The popular Diamond Perforated-metal patterns shown above are only a few of the many illustrated and described in our 32-page Catalog No. 39. All of these standard patterns are available in a wide range of unit-opening sizes and we are always equally pleased to quote on original designs of any type or size.

Catalog 39 also illustrates and describes our high-quality lines of *Ornamental Cane*, *Perforated-Metal Sheets for Acoustical installations* and *Heavy-Duty Architectural Grilles*. Write, today, for a free copy.

Correspondence is especially invited regarding ANY requirement for perforated-metal panels or parts. We are equipped to fabricate special sections to any desired extent and welcome opportunities to make money-saving suggestions.

Manufacturers of DIAMONTEX, the Perforated Metal Lay-In panel for better Acoustical Ceilings. New Bulletin No. 47, gives complete information. Write, today, for free copy.

Parts are moved to and from the work area at the touch of a button

Storage Tiered, Mechanized

A MECHANICAL storage wall has been developed by Triax Equipment, Cleveland.

The storage system, called the Retriever, consists of an electrically operated traveling carrier, steel storage drawers, and a compact loading or transfer station. It can move loads of up to 4000 lb to or from any compartment in the wall.

- **Saves Time**—At the touch of a pushbutton, the Retriever picks up a load, carries it to any desired area in the wall, then rolls it gently into a protected and dust-free drawer or compartment. Material is returned to the work area or shipping platform with the same ease and speed. The system saves time formerly wasted in looking for parts or shifting pallets.

- **Saves Space** — The Retriever makes use of plant or warehouse space from floor to ceiling. Compared with conventional methods it provides up to four times as many cubic feet of storage per square foot of aisle and rack space. This can save the cost of plant additions. George R. Johnson, general manager of Triax, points out. Wide aisles for transportation of materials to storage are unnecessary. The wall can be placed to provide near and quiet separation of work areas.

- **Saves Labor**—Labor cost is greatly reduced, since no special operator is needed to move, store, and stock materials.

Because the system has few moving parts, maintenance cost is low.

It has a 20-year job 3 miles under the sea

Radiography reveals no foreign particles or voids in molded areas, shows the ultimate contact of the molded insulation with the central conductor.

Radiography shows the rubber seal and molded parts are ready to take it

EVERY 40 MILES along a transoceanic telephone cable, there is a repeater—an electronic masterpiece designed to boost the message along and made to operate 24 hours a day for a minimum of 20 years.

Any foreign particles in the molded parts of the seal could reduce its performance. And with sea water pressures up to 8000 lbs. p.s.i. to resist, the adherence of the

rubber seal areas to the central conductor and outer metal shell must approach perfection.

Radiography assists Western Electric to make sure that each repeater measures up to specification.

Using Kodak Industrial X-ray Film, Type AA, the radiographer can inspect each repeater thoroughly, and quickly. This film has the sensitivity and speed to enable

the work to be done even with low-power x-ray equipment.

In all applications, Type AA Film is producing quality work in far less time. It is extending the service of present x-ray equipment, and increasing production with gamma-ray sources.

Have your x-ray dealer or Kodak Technical Representative tell you about it. It saves time and money.

EASTMAN KODAK COMPANY, X-ray Division, Rochester 4, N. Y.

Kodak Industrial X-ray Film, Type AA

Read what Kodak Industrial X-ray Film, Type AA, does for you:

- Speeds up radiographic examinations.
- Gives high subject contrast, increased detail and easy readability at all energy ranges.
- Provides excellent uniformity.
- Reduces the possibility of pressure desensitization under shop conditions.

Riveting machine joins aluminum refrigerator components with semitubular aluminum rivets. Inset: Some popular types of rivets

Aluminum Rivets Upgrade Parts Made of Aluminum

First of a Series of Three Articles

This is the first of three articles on the use of aluminum fasteners for joining aluminum structural parts. Next week's article covers the application of aluminum bolts, machine screws, washers, and nuts. The final article will explain how aluminum sheet-metal screws can save time and money in fabricating aluminum sheets and plates.

A TIP for fabricators of aluminum sheets and plates: If you fasten with rivets, use the aluminum type. You can make a better product less time and at lower cost.

Here's why: Aluminum rivets are easy to work and inexpensive to use. They give aluminum products a uniform appearance, eliminate staining, and prevent electrolytic action, which is caused by the joining of dissimilar metals.

Aluminum rivets are available for virtually every application. Standard types meet all requirements for most joints; many specials are also offered.

- **Choose Compatible Alloy**—The composition of the rivet should be similar to that of the part being joined. Example: Pure aluminum rivets (1100) should be used with products made of pure aluminum or alloys which cannot be heat treated.

Rivets made of medium-strength alloys (such as 6053-T4) are used with medium-strength alloys that

Aluminum Rivets—Driving, Aging, Shear Strength

Alloy, Temper Before Driving	Alloy, Temper After Driving	How Driven	Aging Period for Full Strength	Ultimate Shear Strength (psi)
1100-F	1100-F	Cold (as received)	—	11,000
2017-T4	2017-T3	Cold (as received)	—	39,000
2017-T4	2017-T31	Cold (immediately after quenching)	4 days	34,000
2024-T4	2024-T31	Cold (immediately after quenching)	4 days	42,000
2117-T4	2117-T3	Cold (as received)	—	33,000
6053-T61	6053-T61	Cold (as received)	—	23,000
6061-T6	6061-T6	Cold (as received)	—	30,000
6061-T4	6061-T31	Cold (immediately after quenching)	4 months	26,000*
6061-T4	6061-T43	Hot (990 to 1050° F)	2 weeks	24,000
7277-T4	7277-T41	Hot (850 to 975° F)	1 week	38,000

*Value of 24,000 psi reached in two weeks.

can be heat treated, or with cold worked alloys that cannot be heat treated.

In fabricating high strength alloys, rivets should be made of high tensile strength alloys, such as 7277-T4.

Heat Treatment—Rivets made of heat treatable alloys are always cold in the heat treated temper (solution heat treated, or solution heat treated, then artificially aged). Tempers are changed slightly by cold work in driving and by natural age hardening if the rivets have not been aged artificially.

Rivets that have not been heat treated are always driven cold. Heat treated types made of medium-strength alloys may be driven cold but are often hot driven if they are more than 1/2 in. in diameter. The high strength types are always driven hot.

Rivets that have not been heat treated are always driven cold. Heat treated types made of medium-strength alloys may be driven cold

but are often hot driven if they are more than 1/2 in. in diameter. The high strength types are always driven hot.

Some of the medium strength alloy types drive easier if they are

heat treated, then quenched, immediately before driving. After heat treatment, they begin to age harden but drive readily as much as 2 hours after quenching.

If time elapses between heat treatment and driving, rivets should be kept in cold storage to retard age hardening.

• **Types of Joints**—Standard lap and butt joints are used. Selection hinges on the strength and appearance required.

• **Size and Spacing**—Rivet diameter should be no more than three times the thickness of the heaviest part at the joint.

Distance from the edge of the material to the center of the rivet should be no more than twice the diameter of the rivet. Space between rivets should be enough to allow proper driving, but it should be no more than three times the diameter of the rivets or 24 times the thickness of the metal being joined.

Length depends on rivet diameter, hole size, total thickness of material at the joint, and the type of driven head. The right length can best be determined by an on-the-job test.

• **Holes, Sizes** — Holes may be punched or drilled; except in thin material, they should be reamed or shaved to eliminate rough edges which may cause radial cracking.

Holes should be as close as pos-

tootsietoys

are painted by the millions with
RANSBURG NO. 2 PROCESS

Miniature automobile bodies of the tootsietoy line are efficiently and uniformly painted as trays of cars pass below one of the four Ransburg No. 2 Process atomizing bells.

QUALITY OF THE FINISH IS IMPROVED AND PAINT COSTS ARE CUT 65% WITH *Electrostatic Spray Painting*

Dowst Manufacturing Co., Chicago, are sticklers for quality in the production of tootsietoys which are turned out at the rate of 25 million a year.

That's one reason they changed from hand spray to Ransburg Electrostatic Spray Painting.

RESULTS? Rejects are cut from as much as 5% to about 1%, for they're getting a more uniform, higher quality coating on all parts.

Colors are changed easily, and paint mileage is stepped up substantially. For instance, on one toy item, a gallon of paint coated only 1800 units by hand spray. Now, with Ransburg No. 2 Process, they paint 5500 pieces per gallon. That's because of the unmatched efficiency of Ransburg No. 2 Process.

NO REASON WHY YOU CAN'T DO IT, TOO!

Whatever your product—whether it's large or small—we'd like to show you what RANSBURG ELECTROSTATIC PROCESSES can do for you in YOUR finishing department. Write for our No. 2 Process brochure which shows numerous production line examples of electrostatic spray painting on a wide variety of products.

RANSBURG

Electro-Coating Corp.

P. O. Box 7822 • Indianapolis 23, Indiana

sible to nominal rivet diameter, large enough to permit easy section and prevent production lays. Clearance for cold-driven rivets may be from 0.003 in. for the material to 0.032 in. for material in. thick. Slightly greater clearance is needed for hot driven rivets.

• **Driving Method Optional**
These rivets are driven in the same manner as other types, but squeeze riveters are recommended.

Pneumatic hammers may be used if they are large enough to upset the rivets properly; the right hammer size should be determined by an on-the-job test.

A heavy hammer may be used for heading if the job permits proper bucking.

• **Cone Heads Preferred** — Cone point driven heads are desirable in all applications, unless another type is required for appearance or some other reason. They accommodate the full tensile strength of the rivet shank, require less driving pressure than full button heads, use less stock, and their appearance is changed little by variations in shank length.

• **Machines Do Faster Job**—Machines which handle rivets up to 5/32 in. diameter and will punch stock as thick as 5/32 in. are often used.

The method has gained popularity in the manufacture of store windows and doors, household appliances, and other high-volume products.

• **Semitubular Rivets**—This type is well suited to machine or hand riveting. It is available in several designs for blind riveting, where the work can be reached only from one side.

In deciding what hole size to use it must be remembered that the type does not resist shear or tension as well as solid rivets of the same alloy and size.

The right rivet length can be calculated by adding the clinch allowance to the total thickness of the material joined. It's best determined by test riveting.

• An extra copy of this article is available until supply is exhausted. Write Editorial Service, STEEL, Penton Bldg., Cleveland 13, Ohio.

Slide Assembly Package Has Many Extras

This air-powered, heavy duty slide assembly has smooth, accurate hydraulic feed control.

The package unit includes an air control valve for starting the cycle, and two built-in microswitches that permit interlocking slide operation with other machine functions.

They are available from stock in three convenient sizes, with working surfaces of 4 x 12 in., 6 x 16 in., and 8 x 24 in.; maximum stroke lengths of 4, 6, and 8 in.; and maximum feed strokes of 2, 4, and 6 in., respectively.

An adjustable, positive stop screw permits regulating the length of feed stroke. A choice of control arrangements is available. *Write: Russell T. Gilman Inc., 623 Beech St., Grafton, Wis. Phone: 4526*

Ultrasonic Grinder Handles a Variety of Jobs

The Model 2-335 ultrasonic impact grinder uses a magnetostrictive transducer. Rugged and versatile, it is used for cutting, slicing, drilling, grinding, and trepanning regular or irregular shapes.

Substances worked include semiconductors, ceramics, ferrites, carbides, metals, jewels, and other hard or brittle materials.

The ultrasonic driver produces 100 watts and is based on a design thoroughly proved in the field. The transducer carries a full-year guarantee with an additional 18 months warranted on a prorated basis.

The cutting head is mounted on a rugged base, has a foolproof cutting force adjustment, and a built-in force dial. *Write: Raytheon Mfg. Co., Waltham 54, Mass. Phone: Twinbrook 3-5860*

Rotary Surface Grinders Have Rapid Tilting Spindle

A quick-tilting device for creating wheel clearance on vertical spindle rotary surface grinders permits conversion from rough to finish grinding in seconds.

The Quick-Tilt spindle is available as optional equipment on all Mattison No. 24 and 36 vertical rotary surface grinders. (Control is shown.)

On average grinding operations, output can be increased as much as 50 per cent without sacrificing accuracy. Wheel drag, power loss, and heat buildup are no longer problems when grinding large surfaces.

The advantages of both high stock removal and flat grinding can be realized on individual jobs, and there is no need to compromise accuracy to improve stock removal efficiency. *Write: Mattison Machine Works, Rockford, Ill.*

(Please turn to Page 92)

production problem

Mass-production of modern "wonder alloys" might, in some respects, be compared with an attempt at assembly-line fabrication of Cellini's famed sculpture of "Perseus".

Both would require the careful precision, the intricate craftsmanship of experienced specialists, intimately familiar with ultra-modern production techniques.

Yet within the past year, high volume production of quality specialty steels has become a reality at *Carpenter*. *Ingot tonnage capacity*—the equipment and quality controls required to produce the world's finest steels—has *doubled almost overnight* through the acquisition of steelmaking facilities in Bridgeport, Connecticut.

For many years, demands by American industry for *Carpenter*-quality stainless, tool and alloy steels often exceeded our ability to produce. Like that of all custom-craftsmen, our objective was *quality*, the pioneering of new and better steels, rather than *quantity*.

Today, as the result of long-planned expansion, we can offer *quantity* along with famous *Carpenter quality*. For the first time, with our increased capacity, both quantity and quality are available. And both will continue to be available, even in times of peak demand.

While *quality* will continue to remain a sacred *Carpenter* watchword, we are determined to lead the way and grow apace of the ever-increasing demands of industry for the world's finest specialty steels.

The Model APT-500 Sonoclean generator (3-kw average power output) is designed for high volume production cleaning. It will actively

Positive Protection Against Phase Failure and Phase Reversal

Here is your answer!

The Allen-Bradley Bulletin 812 Type F, Type R, and Type RF relays provide positive protection against the hazards to men, motors, and driven machinery, resulting from phase failure and/or phase reversals.

The Bulletin 812 Style F phase failure relay employs a unique static sensing network that responds to all open phase conditions on a motor branch circuit and immediately removes the motor from the line . . . irrespective of the load on the motor (including no load), or the circuit arrangement. This relay even responds to hard-to-detect primary failures on a wye-delta transformer with ungrounded neutral. Furthermore, the five-cycle response prevents nuisance "drop-outs" from transient fluctuations.

The Bulletin 812 Style R phase reversal relay disconnects the motor from the line—whether it is running or not—when a phase reversal occurs anywhere in the system on the line side of the relay. Thus, it can be employed for a single motor, a group of motors, or an entire power system. In addition, the phase reversal relay prevents the motor from starting should phase failure occur while at a standstill—a vital feature for elevator applications.

The Bulletin 812 Style RF relay combines the elements of Style R and Style F relays for protection against both phase failure and phase reversal. All Bulletin 812 relays are inherently "fail safe." Send for complete information.

ALLEN-BRADLEY

MOTOR CONTROL

Bulletin 812, Style RF
for Phase Failure
and Phase Reversal

INDIVIDUAL RELAY UNITS AVAILABLE

For Phase Failure

Style F covers full load currents from 1.5 to 300 amp in 4 sizes. Coils for up to 600 v, 60 cycles.

For Phase Reversal

Style R made with coils for 110, 208/220, 440, 550 v for either 50 or 60 cycle operation.

"If we stick to **ALLEN-BRADLEY..** our control troubles evaporate

... so says John A. Bradner,
President, Lees-Bradner Co.,
Cleveland, Ohio, machine tool manufacturer.

"Yes, we have chosen Allen-Bradley controls. We use them, like them, and most thoroughly approve of them. We do our level best to see that they're the ones with which LEES-BRADNER machines are equipped.

"It has been our experience in over 25 years of pioneering electrical rather than mechanical control of machine tools that, if we stick to Allen-Bradley, control troubles we are too apt to have otherwise—*evaporate!*"

Lees-Bradner Gear Hobbing Machine,
above, uses six motor control panels as-
sembled from standard A-B components.

This is the electrical control panel for a 12-station Kingsbury Indexing Automatic which performs 19 operations on an automatic transmission part. All the components in this panel are standard A-B control items.

The 78 operations of a huge Buhr Automatic Transfer Machine are controlled by this "special" electrical panel. All the components are standard Allen-Bradley units.

NEW PRODUCTS and equipment

up to 6 sq ft of transducer area, or 100 gallons of cleaning solution. The unit features motor tuning, twin oscillator construction, and remote control. Its control panel allows the operator to adjust the entire cleaning procedure without leaving his post. Write: Branson Ultrasonic Corp., 40 Brown House Rd., Stamford, Conn. Phone: Davis 4-721

Finishing Speed Upped

The Abrado-Matic TS-31 mechanical finishing machine vertically projects parts to be finished in a rotating mass of abrasive media. Tests show the method can reduce finishing time on many parts to as low as 10 seconds.

The process may be used on all types of metals and alloys requiring rapid, low cost, surface processing. It produces uniform results. Write: Abrado Finish Corp., Grand Rapids, Mich.

System Prevents Repeats

The Andrus-Coon system features dual interlocked (but independent) pneumatic-electrical-mechanical circuits, intended to make accidental repeat operation on single cycling machines impossible.

The system is suitable for a press, brake, shear, indexing unit, or like equipment employing an air-operated friction clutch and spring-set brake. Write: Textrol Inc., 4015 Prospect Ave., Cleveland 15, Ohio. Phone: Henderson 2-2161

New

3000-4000 lb.

Returnable spiders (2000-4000 lbs. capacity)

Here is a partial list of the many types of carbon steel wire manufactured by CF&I:

		Standard Types (partial list)			
Grades	Finishes	aircraft cord	fuse	merchant	square
low carbon	bright dry drawn or	bee	Gamma spring	nail	stapling
annealed	lime bright	bobbin ring	garment hanger	oil tempered	staple
flat and shaped	bright grease drawn	bobby pin	glass netting	picker tooth	stone
	cadmium coated	bookbinder	hair pin	picture cord	tie
medium high carbon	coppered	broom	hat	pin ticket	twisted & laid
	extra clean	brush	hose,	regulator	upholstery
	smooth bright	casing	reinforcement	rope	valve spring
high carbon	galvanized	clip	hose, mechanical	safety pin	weaving
flat and shaped	liquor	concrete	hose, vacuum	screen	welding
oil tempered	white liquor	reinforcing tie	lock spring	shaft, flexible	Wissco Iron
spheroidized		cotter pin	lockwasher	Signal Corps	
		curtain spring	manufacturers'	snake fishing	
		die spring	drawn	spiral binding	
		fine & weaving	mattress	spring	

Steel strapped coils (200-2000 lbs.)

WHEN YOU NEED WIRE... MAKE

CONTINUOUS WIRE "SPIDER"

. cuts downtime as much as 15%

. reduces scrap loss

Here's what CF&I's new giant package did for one upholstery spring manufacturer who had been using 700-lb. wire coils:

- Downtime was reduced
- Production was increased 15% per shift
- Men and materials handling equipment were freed for other work
- Scrap losses were reduced

These returnable spiders will cut your

production costs, too. If your manufacturing process is not equipped to use spiders, order our 200-2000 lb. continuous-length, steel-strapped wire coils. (Sizes #13 AWG and coarser apply for both spiders and coils.)

From spools to spiders . . . CF&I's newly modernized and enlarged plants are equipped to provide fast delivery on high or low carbon steel wire . . . round, flat or shaped . . . in a wide variety of sizes, tempers, grades and finishes . . . in small quantities or carload lots. Let us know your requirements.

BEFORE...

Separate Bolts, Nuts and Washers complicate inventories, increase assembly costs.

AFTER...

Washers as integral parts of bolts and nuts eliminate problems, speed assembly at lower cost.

**save
money**
*by simplifying
fastener design*

Here is a simple application of a basic bolt making principle which affects substantial savings.

These savings, resulting from simplified design, are realized in every step of the operation from lower first cost of the fasteners through inventory to final assembly. Totalled, they are well worth while.

There are many other basic principles... often overlooked in designing and specifying fasteners, which are of importance cost-wise.

You'll find them in our new booklet, "How to specify fasteners... and save". Filled with drawings and charts, it makes a handy guide in designing or buying any headed parts. If you can use a copy, write to North Tonawanda or ask a Field Representative.

Slitting Equipment

Equipment for coil and sheet stock slitting is described in Bulletin 44-A. Included are recommended slitting procedures and suggestions on coil handling, width of cut, and use of entry and delivery pinch rolls. E. W. Bliss Co., 1375 Raff Rd. S. W., Canton 10, Ohio.

Switchgear

Detailed information on the operation, characteristics, and application of indoor and outdoor Metal-clad switchgear is covered in Bulletin GEA-5664E. The units are rated at 2.4 to 13.8 kv with interrupting capacities of 75 to 1000 mva. General Electric Co., Schenectady 5, N. Y.

Heavy Duty Strapping

A pocket size catalog, SSS-209, contains all the product information on standard and heavy duty Stanley steel strapping. Hand and power tools, accessories, Colorgraph strapping, and lithographed seals are covered. Stanley Steel Strapping Div., Stanley Works, New Britain, Conn.

Pierce-Nut Units

Specifications for press-actuated Type CD and BL units for short, medium, and long run nut-insertions are covered in a catalog. Flat and embossing dies, and sizes and threads of available Fabristeel Multipierce Nuts are included. Wales-Strippit Inc., 210 S. Buell Rd., Akron, N. Y.

Industrial Tractor

An electronic industrial tractor that requires no operator is described in Bulletin 586. The Guide-O-Matic tractor is controlled by a wire guidance system or a recently developed optical guidance device. Barret-Cravens Co., 628 Dundee Rd., Northbrook, Ill.

Electric Motors

Super-Seal open-type motors suitable for many applications previously requiring enclosed designs are described in Bulletin 05-51B9040. These motors are unaffected by moisture, dust, dirt, oils, acids, or alkalis. Industries Group, Allis-Chalmers Mfg. Co., Milwaukee 1, Wis.

Air Vises

A brochure describes air vises for automatic, self-centering operations within a tolerance of 0.001 in. with holding power up to 4000 lb at 100 psi. Heinrich Tools Inc., Racine, Wis.

Rectifier Power Units

Descriptions, data, and specifications for standard three-phase units and special low voltage units are in this 10-page catalog. Both have capacities from ¼ to 500 kw. Syntron Co., 370 Lexington Ave., Homer City, Pa.

Carbide Gun-Drills

Starbore carbide gun-drills for speed production of precision holes in the solid are described in Catalog SC-1. They combine the features of an oil-drill and a trepanning tool. Star Carbide Co., P. O. Box 376, 34500 Grand 1 Ave., Farmington, Mich.

Permanent Molds

Bulletin 23 describes the use of granite permanent molds in the production of metals and other materials. Meehanite Metal Corp., 714 North Ave., New Rochelle, N. Y.

Generator Set

Highlights of design, engineering, construction of the G-226 portable, 11 kw weight generator set are covered in Catalog BU-412. Engine-Material Handling Div., Allis-Chalmers Mfg. Co., Milwaukee 1, Wis.

Air-Moving Units

Special purpose air-moving units and original equipment manufacturers are described in Bulletin 5412. Covered are packaged centrifugal blowers; vaneaxial, and propeller fans; pressure blowers; and fluid coolers. American Blower Div., American-Standard, Detroit 1, Mich.

Protected Motors

Motors designed for outdoor operation under extreme weather conditions in ratings from 250 to 2000 hp are covered in Bulletin No. 2550. Louis Allis Co., 427 E. Stewart St., Milwaukee 1, Wis.

Coating Machine

The Convert-O-Matic fully automatic straight line, conversion coating machine is covered in a bulletin. It handles blackening, phosphating, bright dipping, precleaning, and pickling operations. H. C. Van Winkle-Munning Co., Church Street, Matawan, N. J.

Honing

A 16-page case history booklet on honing jobs gives production rates and data on size, tolerance, stock removal, and finish on 99 diversified parts from 1/8 to 2 3/4 in. ID. Sunnen Products Co., 79 Manchester Ave., St. Louis 17, Mo.

Steel Castings

A folder describes electric furnace alloy and carbon steel castings. Standard alloy special steel castings are covered. Farrell Cheek Steel Co., Sandusky, Ohio.

Drilling Machine

Specifications on the high speed sensitive drilling machine are presented in Bulletin No. 160 R. The unit is designed to save space, labor, and material in making small components. Edlund Machinery Co., 44 Huntington St., Concord, N. Y.

Drill Jig Bushings

Precision drill jig bushings are described in Catalog 582. Standard Bushing Manufacturers Inc., 1533 Elmwood Ave., Providence 7, R. I.

Mills Stretch Delivery Promises

STEELMAKERS are extending delivery promises as major consumers come into the market for big tonnages. Two months ago, they were quoting four weeks' delivery on cold-rolled sheets. One month ago, minimum leadtime was five weeks. Today, it's six or seven.

Galvanized products are in such tight supply that some mills have quotas for their sales offices. Many producers are booked well into February, and some are sold out through the first quarter of 1959.

In Chicago, consumers are being told that they must keep their orders in line with recent requirements.

Mill executives describe current sheet bookings as a "comfortable backlog" but admit they may be losing orders to competitors who occasionally have overruns in certain grades.

AUTO OUTPUT AT '58 PEAK—Auto production, still the mainstay of the steel market, last week reached its highest level of 1958. Automakers turned out about 148,000 cars—almost as many as in 1957's corresponding week, when strikes weren't such a problem. Steel suppliers are getting a steady flow of orders from car manufacturers but nothing to suggest that buyers are expanding inventories now. Automakers plan a gradual buildup to reach at least 30 days' supply of all products, but it won't start until late in the first quarter of '59. It will probably continue through the second quarter.

APPLIANCES WARM UP—Although they're less conspicuous than autos, appliances are playing a major role in the steel market's recovery. Factory sales of laundry units in October were the highest in two years, exceeded only in October, 1956 (gas dryers and washer-dryers set all-time records). Sales of gas ranges also hit a two-year high last month, while shipments of gas fired automatic water heaters were the best since early 1956. Flushed with sudden prosperity, appliance makers are giving steelmen an early Christmas gift: Bigger orders for cold-rolled and silicon strip.

TUBULAR PRODUCTS SLOW—Demand for seamless and butt-weld standard pipe is ebbing with the seasonal decline in construction activity. Line pipe business is also deteriorating, and producers see little likelihood of an upturn before January. Says an industry leader: "If the Supreme Court reversed the Memphis decision today, there'd be no great influx of orders tomorrow,

but the gas transmission companies could at least do some planning. We look for better shipments in 1959, with a bulge at midyear." Demand for oil country goods is improving slowly as drillers liquidate their inventories.

FORECAST FOR '59—Bethlehem Steel Co. expects next year's steel production to be 110 million ingot tons, with operations averaging 76 per cent of capacity. Says David C. Roscoe, assistant general manager of sales: "Use of steel by the automotive, railroad, mining, quarrying, and lumbering industries will probably increase by more than 20 per cent. Construction and consumer durable goods industries will take 5 to 20 per cent more steel than they did in 1958. Among civilian users, shipbuilders and aircraft manufacturers will take the same tonnage or 5 per cent less."

PRODUCTION SLIPS—Last week, steelmaking operations slipped 1 point to 74 per cent of capacity. Production was about 1,997,000 net tons of steel for ingots and castings. November's output hit 8.6 million ingot tons—200,000 less than the industry produced in October. Total for 11 months: 76.5 million. If December's output matches November's, 1958 production will be 85 million tons.

(1) Currently for Atomic Energy Commission use. Will offer products for commercial sale when conditions permit.

(2) Furnaces used for research and commercial production.

(3) Would be reduced some if titanium demand increases significantly.

(4) Uses 600 lb furnace for research and commercial production.

(5) Facilities include six, 300 lb, vacuum induction furnaces; four, 300 lb, consumable electrode vacuum furnaces, and five, 10 lb, non-consumable electrode vacuum furnaces for research, AEC, and commercial production.

(6) Does not include a 50 lb experimental furnace or a 350 lb induction vacuum unit for the pouring of castings.

(7) Company will make vacuum melted alloys in titanium and zir-

conium furnaces having annual capacity of 14 million to 18 million lb. (8) Does not include an experimental furnace at Cincinnati with annual capacity of 1.5 million lb.

(9) Furnaces used for research and commercial production.

(10) Capacity for making vacuum melted alloys will vary, depending on demand for titanium.

(11) Producing classified material, but hopes to offer for commercial sale in near future.

(12) Includes 8 million lb of capacity being installed for operation later this year or early 1959.

(13) Capacity for single melting. Capacity for double melting is 1.5 million lb.

(14) Furnace with 2.4 million lb of capacity is being installed.

Vacuum Melting Gains

New producers and continuing research bring developments in ingot size, new alloys, supply, price, quality, furnace design, and uses which may benefit you

IF IT'S been six months or more since you last considered using vacuum melted metals, it's time for another look. And if you don't find what you want today, mark your calendar to look again six months from now.

Consider just a few of the changes which have come about within the last year or two. They may help you save money or improve your product.

• No. 1, Ingot Size—Last year, the

biggest ingot that could be produced by the vacuum induction process was 3000 lb. Today, it's 5000 lb. For the vacuum consumable electrode process, the maximum in 1957 was 12,000 lb. Soon, a 40 in. diameter, 40,000 lb ingot will be available. Lectromelt Furnace Div. of McGraw-Edison Co., Pittsburgh, is engineering a furnace that will handle that size.

• No. 2, New Alloys—Producers are uncovering new alloys almost faster than they can name them. And old air melted alloys are being vacuum

melted with results which give them a new set of physicals. In STEEL's 1956 Metal Selector, only 53 vacuum melted metals and alloys were listed. In the 1958 edition (insert, Oct. 20 issue), there were 116.

• **No. 3, Supply**—In 1957, supply was a problem confronting potential users of these metals. The 1956 Metal Selector listed only eight sources. In July, 1957, STEEL listed 20 commercial producers, some of whom were basically titanium or zirconium producers using excess furnace ca-

capacity to turn out other vacuum melted metals. Thirty producers are listed on Page 103. With the slump in demand for titanium, more capacity is being made available for other metals.

In addition to the Page 103 list, several companies, such as Hoskins Mfg. Co., Detroit, and International Nickel Co. Inc., New York, and Vanadium Corp. of America, Cambridge, Ohio, have small research furnaces. Inco produces a small amount of nickel alloy for sale. Also, some investment casting pro-

ducers, such as Misco Precision Casting Co., Whitehall, N. Y., have units for vacuum melting and casting of high-purity metals. Occasionally, they use the melt stage for making commercial al-

It is difficult to peg the exact capacity of the industry, but W. J. Dyrkacz, manager of quality control for Allegheny Ludlum Corp. at Watervliet, N. Y., estimates that annual induction melting capacity will be 27 million lb. by the end of this year, and consumable electrode capacity will be 100 million lb.

• **No. 4, Price**—One of the big drawbacks has been price, and still a problem. But most respondents to STEEL's survey indicate price has been lowered between 10 and 15 per cent on the average over the last year. They feel further reductions will be possible as production efficiency and output increase. The big price disadvantage is for the simple alloys, which may cost five or six times as much as similar air melted alloys. But for more complex compositions, producers say vacuum melted metals may even be cheaper than air melted counterparts.

Initial cost is not always the most important factor, producers claim. Increased yield, higher quality, and better workability often offset higher cost. P. J. Wooding, manager of engineering services, Vacuum Furnace Dept., LECTROMELT Furnace Div., McGraw-Edison says: "It can frequently be shown that reduction in rejects of parts already carrying machining costs will justify the premium involved." And many times it's simply a matter of the vacuum melted metal being able to do what an air melted metal cannot.

• **No. 5, Quality**—Purity and quality are inherent in vacuum melted metals, but for some applications even better characteristics are required. With induction furnace melting there is the danger of crucible contamination, although this process generally produces the cleanest metal. With consumable arc furnace melting the quality of the product is limited somewhat by the quality of the arc melted electrode. Several companies are working on a combination of the two processes—using an induction melted electrode in the arc

Steel Roof Decks and Flooring cold rolled up to 200 f.p.m. on this mammoth

ROLL FORMING MACHINE

ARDCOR Roll Forming Machines feature: Unit Design—spindles in self-contained SEPARATE HOUSINGS, with speed reducers; Large Range of Vertical Centers; Double Bearing Design of Drive Housings; All Bearings are Anti-Friction; Micrometer Type Dials and Scales.

This entire automated production line is 15 ft. wide, 6 ft. high and 120 ft. long with total equipment weighing approximately 175 tons. Mill stands are completely movable, having 4½ in. dia. spindles with 42 in. roll space.

Fed by 20,000 lb. steel coils, the twenty-two roll passes form the 1½ in. deep by 2 ft. wide sections. The mill operator controls the loading, lining-up and feeding of the coil stock from a control bridge at entry of the mill. A 150 ton Straight Sided ARDCOR Press cuts off sections to proper lengths.

ARDCOR Roll Forming Machines, are available in six standard sizes, other sizes to customer specifications.

If your products can be cold roll formed, ARDCOR engineers can supply advancements in design and construction to produce them better . . . at greater speeds and profit!

melting furnace. Costs are naturally higher, but for certain applications, it can be justified.

No. 6, Furnace Design—Furnace design and installation improvements are extending the markets for these metals, too. Most producers find that 5000-lb ingots are the maximum for induction melted metals. Mr. Wooding says that vacuum furnace size "is limited only by engineering problems and the availability of capital for experimentation. If an 80 in. diameter ingot can be produced in a vacuum arc furnace, many of the turbine rotors presently being stream degassed will be purchased as vacuum arc melted ingots."

Mr. Wooding reports that power supply problems for vacuum arc furnaces are being overcome with the development of a new power supply. A single package unit can now be built, using water-cooled silicon diodes to suit any given size of furnace. This development has produced the following savings: Power supply cost reduction of 25 per cent; space requirement reduction of 40 per cent; increase in efficiency of 10 to 15 per cent; improvement in power factor of 10 to 15 per cent. "Such developments eventually might effect further reduction in the price of these metals."

No. 7, New Uses—The logical result of these advances is the extension of the markets for vacuum melted metals. As little as two years ago, aircraftmakers took the lion's share of the alloys and superalloys produced in a vacuum, especially for jet engines. While they still are considered by many producers as the greatest potential users, others have climbed onto the bandwagon. Electronics partmakers are finding new applications. Radio Corp. of America is developing uses for high-purity metals in tube parts. Missiles are a natural for superalloys and other metals made in a vacuum. Several producers think the bearing field has great potential, and many are counting on turbines to up their sales. The Atomic Energy Commission has been a big customer, and many producers feel that civilian application of nuclear power will boost sales in the not too distant future.

Other potential markets mentioned are machinery, tool steels, airframes,

honeycomb structures. In fact, one industry official says that wherever precision parts, extensive machining, or extremely high quality are involved, vacuum melted metals will find economical use.

Steel Bars . . .

Bar Prices, Page 112

While demand for merchant steel bars continues to edge upward, most buyers are ordering cautiously. They appear to be holding back orders until the last minute. Roll-

ing cycles are being watched closely.

Distributors, cold drawers, and fastener manufacturers are specifying a little more actively. In general, two to four weeks is the range on deliveries on hot-rolled bars. New business in cold finished is coming in at a much better rate than it was a couple months ago.

A full line of 4-D wrought iron bars, rounds, and angles will be available from A. M. Byers Co., Pittsburgh, beginning Dec. 15. Bars (Please turn to Page 108)

ABELL-HOWE

UNDERHUNG CRANES

now with

FORGED ALLOY STEEL WHEELS, GEARS and PINIONS

Only Abell-Howe offers you forged steel dependability at all critical points of wear—wheels, gears and pinions! Furthermore, Abell-Howe rugged outrigger construction keeps bridge in square—provides lateral bracing for bridge girder. Smooth fluid drive provides cushioned starts whatever the load—reduces reversing shocks. To further assure smooth operation and lasting service, anti-friction bearings used throughout—with double row ball bearings in end truck wheels. Here's crane value that can't be beat!

200 TONS AN HOUR CONTINUOUSLY

200 tons of steel slabs are heated to rolling temperature every hour, continuously, in each of these Surface monsters—world's largest slab furnaces.

No other furnace today can list all of these features:

- 1 Cantilever skid supports* permitting unobstructed combustion space for underfiring.
- 2 Furnace lines and burner design which provide high heat input from the moment the slab enters the furnace.
- 3 Built-in control* to prevent intermingling of gases from upper and bottom zones, providing better control of heat application, and preventing overheated slab end.
- 4 Anticipatory control which reduces temperature head when rate of slab discharge decreases.
- 5 Air preheat up to 1100°F.
- 6 Television signal to pusher pulpit, informing operator of the exact position of the leading slab.

This is another demonstration that, at Surface, unconventional thinking and conventional experience are a productive team for the steel industry. Surface Combustion Corporation, 2408 Dorr St., Toledo 1, Ohio.

Reinforcing Bars . . .

Reinforcing Bar Prices, Page 112

Foreign bars are competing increasingly with the domestic product at many points. On the West Coast, imported bars are reported selling at \$5.50 per 100 pounds, or

about \$1 a hundred under domestic producers' mill quotations.

Some slackening in bar needs is expected as the seasonal decline in highway building and other construction gets underway. Favorable weather in many areas of the country has enabled contractors to get in a lot of extra time. Substantial ordering for highway construction is expected over the winter months as plans are pushed for spring programs.

Seasonal letdown in construc-

tion activities is being reflected in demand for other items. A number of orders are still being booked as delivery releases are dwindling. Contractors pouring less concrete on roads and bridges.

Republic Steel Entering Aluminized Sheet Market

Republic Steel Corp., Cleveland, is entering the aluminized sheet market. It will supply the product in coils from its Warren, Ohio, Works. First production may start out this month.

A large part of the market for aluminized sheets is in auto mufflers; a still broader application is seen as prices on the product are made more competitive with steel products, such as galvanized sheets.

Armco Steel Corp., Middletown, Ohio, has been the sole producer of aluminized until recently. U.S. Steel was scheduled to begin production of cut lengths at its Co. Works beginning this quarter, and coils at its Irvin Works in the second quarter, 1959. Armco has been supplying coils, the product is reported to be clamored for.

Since aluminized sheets cost one-fourth to one-third more than galvanized sheets, there may not be many additional uses in automobiles other than mufflers until prices are reduced. Aluminized stock is reported booked up well into the quarter.

Plates . . .

Plate Prices, Page 112

Heavy and wide plates are in stronger demand. They are getting a mild lift from a pickup in new freight carbuilding and repair programs—further activity is anticipated next year. In general, plate orders are spotty, and are expected to continue so the rest of this year.

The Atomic Energy Commission has awarded a \$1,587,000 contract to Shaw & Estes Inc., Dallas, for reactor facilities at the Hanford Works. It includes tank work. Another substantial pending plate tonnage is for a pipe project at Glasgow, Mont., air base. Chicago Bridge & Iron Co., Seattle, is lo-

STAINLESS COSTS LESS THAN ALUMINUM—

Do you know that the square-foot cost of

stainless steel sheet for curtain wall panels is usually equal to or lower than aluminum when compared in thicknesses of equal indentation resistance? For example, Type 302 stainless steel, .022" thick is equal to .051" aluminum and costs only 62¢ per sq. ft., as compared to 67¢ per sq. ft. for 3003-H14 anodized aluminum.

bidder at \$40,865 for an elevated tank near Seattle.

Ingalls Shipbuilding Corp., Birmingham, has been awarded a contract to build ten open hopper barges for Mississippi Valley Barge Line Co. They will be 195 ft long and 45 ft wide, with a cargo capacity of 1400 tons each.

Plate fabricators hold small backlogs, and competition for new business is keen.

Sheets, Strip . . .

Sheet & Strip Prices, Pages 113 & 114

Inquiry for the tonnage flat-rolled items (hot and cold rolled sheets) continues to improve, though automotive demand is less pressing than it was in recent weeks. Deliveries are largely unchanged, with hot-rolled shipments ranging three to four weeks, and cold-rolled five to six. Upon occasion, shorter deliveries are possible.

The relative stability of deliveries indicates that production is keeping pace with the increase in demand. Strip steel deliveries are possible for December.

Auto business has tapered off as result of inventory buildups during October. The carmakers are not using as much steel as had been anticipated, but miscellaneous manufacturing requirements, including appliances, are still expanding. Electrical sheet needs have picked up some on appliance account. Silicon sheets now can be had in about six weeks, with demand for the lower grades (which go into fractional horsepower motors) relatively better than for the higher grades, required for large generators.

About the hottest flat-rolled product is galvanized sheets. While tonnage isn't being allocated by the mills, the latter are keeping a restrictive hand on orders. A consumer in the Midwest, for example, can't place an order that is much out of line with his recent requirements. Even warehouses, which are not enjoying the boom in orders that the steel mills are experiencing, are getting a good demand for galvanized, and they are finding stock replacements slow. Some makers of galvanized sheets are sold out into February, beyond in a few instances.

While the government is not in

Aftercooler and Cyclone Separator designed for cleaner, dryer compressed air

R. P. ADAMS CO., INC.

222 East Park Drive, Buffalo 17, New York

The Adams Aftercooler and Cyclone Separator are designed to efficiently condense and remove water from compressed air and process gas. Condensed moisture and entrained dirt and oil are subsequently removed in a cyclone type separator. This unit is scientifically designed for maximum removal efficiency over a wide range of flow rates.

For normal use, units are available to cool gases to within 10° F of the temperature of the cooling water. Specially designed units are available to permit a 2° F approach to cooling water temperature, for application where low moisture content is critical.

Adams Aftercoolers and Separators are available from stock to handle 20 - 40,000 cfm with 10° cooling and 25 - 19,200 cfm

where it is necessary to cool within 2° F of the cooling water. Special units can be supplied to suit an unlimited range of requirements. In all cases the maximum pressure loss at rated capacities is ½ psi.

This wide range of sizes enables the economical utilization of Adams Aftercoolers and Separators in virtually all industrial application. For further information on how R. P. Adams' units will solve your compressed air problems and save you money, write today for Bulletin 711.

Keep Plant Air CLEAR of Welding Fumes

Welding shops equipped with Ruemelin Fume Collectors are assured of a clean, healthful atmosphere. Harmful fumes, heat and smoke are eliminated at their source, before they have a chance to spread throughout the shop. This lessens fatigue . . . improves working conditions . . . paves the way for increased plant production. Ruemelin Fume Collectors are approved by Industrial Commissions and insurance companies. Thousands in service. Available with 9 ft., 15 ft., 17 ft. and 20 ft. reach. Write for Bulletin No. 37-E.

RUEMELIN MFG. CO.

A 8755-1/2P

the grain bin business this year, it is making it easy for farmers to buy and pay for bins, with full ownership in a couple of years. In such circumstances, the farmers can't resist buying, and this is an important facet of the situation in galvanized sheets.

Republic Steel Corp. has issued a revised card of extras on cold-rolled sheets. It makes a number of minor changes in the list effective since Dec. 17, 1956.

Stainless Steel . . .

Stainless Steel Prices, Page 116

New England distributors are slightly increasing their inventories of stainless flat-rolled products and bars. They have been placing heavier orders this month.

General Stores Supply Office, Navy, Philadelphia, has placed 200 tons of stainless sheets, 1100 tons going to Ingersoll Steel Div., Borg-Warner Corp., Chicago, and the balance in two contracts to: Washington Steel Corp., Washington, Pa., and G. A. Feld Co., New York.

Imported Steel Prices
Advanced Slightly

After some maneuvering, imported steel prices have been stabilized in the Southwest at an average of 5 cents over October levels. Deliveries average two to three months, except for one mill which has a six to seven month range.

Representatives of several French mills are attempting to fill rolling schedules which were knocked full

of holes when the De Gaulle government canceled several commitments with the Soviet bloc nations.

Domestic mills lost another round in the fight for home markets in the Southwest when the Louisiana Highway Department rejected a request to ban imported steel in road building projects.

Tubular Goods . . .

Tubular Goods Prices, Page 116

Production of continuous butt-weld pipe is moving ahead steadily. The mills are booking December delivery orders. Favorable weather has contributed to strong demand for construction projects.

A little quickening in demand for oil country tubing is noted at Pittsburgh. One area producer says his November shipments will be second only to those last June when business was stimulated by price-protection ordering. The producer thinks his December shipments will top those in November by at least 10 per cent.

Mechanical tubing is moving in fair volume for this season. The product goes into a multitude of manufactured items, including outdoor swings, playground equipment, lawn furniture, and household equipment. Demand for summer goods probably won't be felt for another 45 to 60 days.

Pig Iron . . .

Pig Iron Prices, Page 119

Most pig iron sellers expect shipments to continue light through the end of the year. Observance of holidays and the desire of consumers to maintain low inventories for

yearend accounting consideration will tend to restrict the movement.

Jobbing foundries are operating on low order backlogs (one to two weeks is quite common). Shops which are running more than 40 hours a week are rare.

Blast Furnace Production
Rises During October

Blast furnace production (pig iron, ferromanganese, and spiegeleisen) totaled 5,872,958 net tons in October, reports the American Iron & Steel Institute. It compares with output of 5,072,390 net tons in September, and with 6,519,478 in October, 1957.

Of the total October output, 36,963 tons were ferroalloys, vs. 31,342 in September, and 65,028 in October last year.

Production in the first ten months this year totaled 45,754,044 tons, of which 378,676 tons were ferroalloys. In the like period last year, output totaled 68,280,111 tons, of which 647,267 tons were ferroalloys.

Output by states:

\$2027.00

what's a bar of steel worth?

Did you ever figure out what a bar of steel is worth?

Take this piece of steel, for instance. It's an ordinary round bar . . . selling price, \$13.76. But it could be worth the figure shown on the tag above.

Here's a typical case: One of our customers, facing a breakdown, ordered such a bar. A short time later it was delivered. An overnight delay would have cost this customer \$2,027.00 in time alone.

Whether you require a bar of steel or several carloads, the material can be worth no more than the service behind it and no steel service center has built a better reputation for dependable service than Levinson. If you call us or drop us a note, our salesman will be glad to tell you about our 30,000 ton inventory, about our 13 acres of fabricating and warehousing facilities all under roof, about our technical and engineering assistance. But most important, he will tell you about the people in the Levinson organization who are dedicated to giving you the kind of out-of-stock steel service you deserve.

Warehousemen, fabricators, designers of steel for over half a century.

PRESS BRAKE LINE

performs wide variety of jobs
at Precision Scientific Company

From 15 tons up, there is a Verson Power Press Brake to meet every requirement for forming, bending, coping, notching or punching. Catalog B-55 illustrates and describes the six series, both mechanically and hydraulically operated, that make up the Verson Power Press Brake line. Write for your copy, today.

This line-up of five press brakes is installed in the modern manufacturing plant of Precision Scientific Company, Chicago, Illinois. The company manufactures a complete assortment of laboratory testing equipment, primarily for hospitals and the petroleum industry. The Verson Press Brakes perform a wide variety of bending, forming, punching, beading and notching operations on many of these laboratory products.

Stainless steel is the material most commonly worked. However, aluminum and cold rolled stock are also handled.

If your shop must handle a wide variety of jobs as a part of daily production routine, a combination of machines chosen from Verson's extensive press brake line may be your most effective profit builder. Verson Application Engineers will be pleased to go over your requirements and help you select the line-up that will give you the versatility and production efficiency you need at minimum cost. Call or write, today.

A Verson Press for every job from 60 tons up.

Fire Clay Brick (per 1000)

High-Heat Duty: Ashland, Grahn, Hayward, Hitchens, Haldeman, Olive Hill, Ky., Athens, Troup, Tex., Beech Creek, Clearfield, Curwensville, Lock Haven, Lumber, Orviston, West Decatur, Winburne, Snow Shoe, Pa., Bessemer, Ala., Farber, Mexico, St. Louis, Vandalia, Mo., Ironton, Oak Hill, Parrall, Portsmouth, Ohio, Ottawa, Ill., Stevens Pottery, Ga., \$140; Salina, Pa., \$145; Niles, Ohio, \$138; Cutler, Utah, \$165.

Super-Duty: Ironton, Ohio, Vandalia, Mo., Olive Hill, Ky., Clearfield, Salina, Winburne, Snow Shoe, Pa., New Savage, Md., St. Louis, \$185; Stevens Pottery, Ga., \$195; Cutler, Utah, \$233.

Silica Brick (per 1000)

Standard: Alexandria, Claysburg, Mt. Union, Sproul, Pa., Ensley, Ala., Pt. Matilda, Pa., Portsmouth, Ohio, Hawstone, Pa., \$158; Warren, Niles, Windham, Ohio, Hays, Latrobe, Morrisville, Pa., \$163; E. Chicago, Ind., Joliet, Rockdale, Ill., \$168; Lehigh, Utah, \$175; Los Angeles, \$180.

Super-Duty: Sproul, Hawstone, Pa., Niles, Warren, Windham, Ohio, Leslie, Md., Athens, Tex., \$157; Morrisville, Hays, Latrobe, Pa., \$168; E. Chicago, Ind., \$167; Curtner, Calif., \$182.

Semisilica Brick (per 1000)

Clearfield, Pa., \$140; Philadelphia, \$137; Woodbridge, N. J., \$135.

Ladle Brick (per 1000)

Dry Pressed: Alsey, Ill., Chester, New Cumberland, W. Va., Freeport, Johnstown, Merrill Station, Vanport, Pa., Mexico, Vandalia, Mo., Wellsville, Ironton, New Salisbury, Ohio, \$98.75; Clearfield, Pa., Portsmouth, Ohio, \$102.

High-Alumina Brick (per 1000)

50 Per Cent: St. Louis, Mexico, Vandalia, Mo., \$235; Danville, Ill., \$253; Philadelphia, Clear-

field, Pa., \$230; Orviston, Snow Shoe, Pa., \$260.

60 Per Cent: St. Louis, Mexico, Vandalia, Mo., \$295; Danville, Ill., \$313; Clearfield, Orviston, Snow Shoe, Pa., \$320; Philadelphia, \$310. 70 Per Cent: St. Louis, Mexico, Vandalia, Mo., \$335; Danville, Ill., \$353; Clearfield, Orviston, Snow Shoe, Pa., \$360; Philadelphia, \$350.

Sleeves (per 1000)

Reesdale, Johnstown, Bridgeburg, Pa., St. Louis, \$188.

Nozzles (per 1000)

Reesdale, Johnstown, Bridgeburg, Pa., St. Louis, \$310.

Runners (per 1000)

Reesdale, Johnstown, Bridgeburg, Pa., \$234.

Dolomite (per net ton)

Domestic, dead-burned, bulk, Billmeyer, Blue Bell, Williams, Plymouth Meeting, York, Pa., Millville, W. Va., Bettsville, Millersville, Martin, Woodville, Gibsonburg, Narlo, Ohio, \$16.75; Thornton, McCook, Ill., \$17; Dolly Siding, Bonne Terre, Mo., \$15.60.

Magnesite (per net ton)

Domestic, dead-burned, 1/2 in. grains with fines: Chewelah, Wash., Luning, Nev., \$46; 3/4 in. grains with fines: Baltimore, \$73.

Fluorspar

Metallurgical grades, f.o.b. shipping point in Ill., Ky., net tons, carloads, effective CaF₂ content 72.5%, \$37-\$41; 70%, \$36-\$40; 60%, \$33-\$36.50. Imported, net ton, f.o.b. cars point of entry, duty paid, metallurgical grade: European, \$30-\$33, contract; Mexican, all rail, duty paid, \$25; barge, Brownsville, Tex., \$27.

Ores

Lake Superior Iron Ore

(Prices effective for the 1958 shipping season, gross ton, 51.50% iron natural, rail of lower lake ports.)

Ferroalloys

MANGANESE ALLOYS

Spiegeleisen: Carlot, per gross ton, Palmerton, Neville Island, Pa. 21-23% Mn, \$105; 19-21% Mn, 1-3% Si, \$102.50; 16-19% Mn, \$100.50.

Standard Ferromanganese: (Mn 74-76%, C 7% approx) base price per net ton, \$245. Johnston, Duquesne, Sheridan, Neville Island, Pa.; Alloy, W. Va.; Ashtabula, Marietta, O.; Sheffield, Ala.; Portland, Ore. Add or subtract \$2 for each 1% or fraction thereof of contained manganese over 76% or under 74%, respectively. (Mn 79-81%), Lump \$253 per net ton, f.o.b. Anaconda or Great Falls, Mont. Add \$2.60 for each 1% above 81%; subtract \$2.60 for each 1% below 79%, fractions in proportion to nearest 0.1%.

High-Grade Low-Carbon Ferromanganese: (Mn 85-95%). Carload, lump, bulk, max 0.07% C, 35.1c per lb of contained Mn, carload packed 36.4c, ton lots 37.9c, less ton 39.1c. Delivered. Deduct 1.5c for max 0.15% C grade from above prices, 3c for max 0.03% C, 3.5c for max 0.5% C, and 6.5c for max 75% C—max 7% Si. **Special Grade:** (Mn 90% min, C 0.07% max, P 0.06% max). Add 2.05c to the above prices. Spot, add 0.25c.

Medium-Carbon Ferromanganese: (Mn 80-85%, C 1.25-1.5%, Si 1.5% max). Carload, lump, bulk, 25.5c per lb of contained Mn, packed, carload 26.8c, ton lot 28.4c, less ton 29.6c. Delivered. Spot, add 0.25c.

Manganese Metal: 2" x D (Mn 95.5% min, Fe 2% max, Si 1% max, C 0.2%). Carload, lump, bulk, 45c per lb of metal; packed, 45.75c; ton lot 47.25c; less ton lot 49.25c. Delivered. Spot, add 2c.

Electrolytic Manganese Metal: Min carload, bulk, 33.25c; 2000 lb to min carload, 36c; less ton, 38c; 50 lb cans, add 0.5c per lb. Premium for hydrogen-removed metal, 0.75c per lb. Prices are f.o.b. cars, Knoxville, Tenn., freight allowed to St. Louis or any point east of Mississippi River; or f.o.b. Marietta, O., freight allowed.

Silicomanganese: (Mn 65-68%). Carload, lump, bulk 1.50% C grade, 18-20% Si, 12.8c per lb of alloy. Packed, c.l. 14c, ton 14.45c, less ton 15.45c, f.o.b. Alloy, W. Va.; Ashtabula, Marietta, O.; Sheffield, Ala.; Portland, Ore. For 2% C grade, Si 15-17%, deduct 0.2c from above prices. For 3% grade, Si 12-14.5% deduct 0.4c from above prices. Spot, add 0.25c.

TITANIUM ALLOYS

Ferrotitanium, Low-Carbon: (Ti 20-25%, Al 3.5% max, Si 4% max, C 0.10% max). Contract, ton lot, 2" x D, \$1.50 per lb of contained Ti; less ton to 300 lb, \$1.55. (Ti 38-45%, Al 8% max, Si 4% max, C 0.10% max). Ton lot \$1.35, less ton to 300 lb \$1.37, f.o.b. Niagara Falls, N. Y., freight allowed to St. Louis.

Ferrotitanium, High-Carbon: (Ti 15-18%, C 6-8%). Contract min c.l. \$240 per ton, f.o.b. Niagara Falls, N. Y., freight allowed to destinations east of Mississippi River and north of Baltimore and St. Louis. Spot, \$245.

Ferrotitanium, Medium-Carbon: (Ti 17-21%, C 2-4%). Contract, c.l. \$290 per ton, f.o.b. Niagara Falls, N. Y., freight not exceeding St. Louis rate allowed. Spot, \$295.

CHROMIUM ALLOYS

High-Carbon Ferrochrome: Contract, c.l. lump, bulk 28.75c per lb of contained Cr; c.l. packed 30.30c, ton lot 32.05c; less ton 33.45c. Delivered. Spot, add 0.25c.

Low-Carbon Ferrochrome: Cr 63-66% (Simplex), carload, lump, bulk, C 0.025% max, 36.75c per lb contained Cr; 0.010% max, 37.75c. Ton lot, add 3.5c; less ton, add 5.2c. Delivered.

Cr 67-71%, carload, lump, bulk, C 0.02% max, 41.00c per lb contained Cr; 0.025% max, 39.75c; 0.05% max, 39.00c; 0.10% max, 38.50c; 0.20% max, 38.25c; 0.50% max, 38.00c; 1.0% max, 37.75c; 1.5% max, 37.50c; 2.0% max, 37.25c. Ton lot, add 3.4c; less ton lot, add 5.1c. Delivered.

Foundry Ferrochrome, High-Carbon: (Cr 61-66%, C 5-7%, Si 7-10%). Contract, c.l., 2 in. x D, bulk 30.8c per lb of contained Cr. Packed, c.l. 32.4c, ton 34.2c, less ton 35.7c. Delivered. Spot, add 0.25c.

Foundry Ferrosilicon Chrome: (Cr 50-54%, Si 28-32%, C 1.25% max). Contract, carload packed, 8M x D, 21.25c per lb of alloy, ton lot 22.50c; less ton lot 23.70c. Delivered. Spot, add 0.25c.

Ferrochrome-Silicon: Cr 39-41%, Si 42-45%, C 0.05% max or Cr 33-36%, Si 45-48%, C 0.05% max. Carload, lump, bulk, 3" x down and 2" x down, 28.25c per lb contained Cr, 14.60c per lb contained Si, 0.75" x down 29.40c per lb contained Cr, 14.60c per lb contained Si.

Chromium Metal, Electrolytic: Commercial grade, (Cr 99.8% min, metallic basis, Fe 0.2% max). Contract, carlot, packed 2" x D plate (about 1/4" thick) \$1.15 per lb, ton lot \$1.17, less ton lot \$1.19. Delivered. Spot, add 5c.

VANADIUM ALLOYS

Ferrovandium: Open-hearth grade (V 50-55%, Si 8% max, C 3% max). Contract, any quantity, \$3.20 per lb of contained V. Delivered. Spot, add 10c. **Special Grade:** (V 50-55% or 70-75%, Si 2% max, C 0.5% max) \$3.30. **High Speed Grade:** (V 50-55% or 70-75%, Si 1.50% max, C 0.20% max) \$3.40.

Grainal: Vanadium Grainal No. 1 \$1.05 per lb; No. 79, 50c, freight allowed.

Vanadium Oxide: Contract less carload lot, packed, \$1.38 per lb contained V₂O₅, freight allowed. Spot, add 5c.

SILICON ALLOYS

50% Ferrosilicon: Contract, carload, lump, bulk, 14.6c per lb of contained Si. Packed c.l. 17.1c, ton lot 18.55c, less ton 20.20c, f.o.b. Alloy, W. Va.; Ashtabula, Marietta, O.; Sheffield, Ala.; Portland, Ore. Spot, add 0.45c.

Low-Aluminum 50% Ferrosilicon: (Al 0.40% max). Add 1.45c to 50% ferrosilicon prices.

65% Ferrosilicon: Contract, carload, lump, bulk, 15.75c per lb contained silicon. Packed, c.l. 17.75c, ton lot 19.55c, less ton 20.9c. Delivered. Spot, add 0.35c.

75% Ferrosilicon: Contract, carload, lump, bulk, 16.9c per lb of contained Si. Packed, c.l. 18.8c, ton lot 20.45c, less ton 21.7c. Delivered. Spot, add 0.3c.

90% Ferrosilicon: Contract, carload, lump, bulk, 20c per lb of contained Si. Packed, c.l. 21.65c, ton lot 23.05c, less ton 24.1c. Delivered. Spot, add 0.25c.

Silicon Metal: (98% min Si, 1.00% max Fe, 0.07% max Ca). C.l. lump, bulk, 21.5c per lb of Si. Packed, c.l. 23.15c, ton lot 24.45c, less ton 25.45c. Add 0.5c for max 0.03% Ca grade. Add 0.5c for 0.50% Fe grade analyzing min 98.25% min Si.

Alsifer: (Approx 20% Al, 40% Si, 40% Fe). Contract, basis f.o.b. Niagara Falls, N. Y., lump, carload, bulk, 9.85c per lb of alloy; ton lot, packed, 10.85c.

ZIRCONIUM ALLOYS

12-15% Zirconium Alloy: (Zr 12-15%, Si 39-43%, C 0.20% max). Contract, c.l. lump, bulk, 9.25c per lb of alloy. Packed, c.l. 10.45c, ton lot 11.6c, less ton 12.45c. Delivered. Spot, add 0.25c.

35-40% Zirconium Alloy: (Zr 35-40%, Si 47-52%, Fe 8-12%, C 0.50% max). Contract, carload, lump, packed 27.25c per lb of alloy, ton lot 28.4c, less ton 29.65c. Freight allowed. Spot, add 0.25c.

BORON ALLOYS

Ferroboron: 100 lb or more packed (B 17.50% min, Si 1.50% max, Al 0.50% max, C 0.50% max). Contract, 100 lb or more 1" x D, \$1.20 per lb of alloy; less than 100 lb \$1.30. Delivered. Spot, add 5c. F.o.b. Washington, Pa., prices, 100 lb and over are as follows: Grade A (10-14% B) 85c per lb; Grade B (14-18% B) \$1.20; Grade C (19% min B) \$1.50.

Borosil: (3 to 4% B, 40 to 45% Si). Carload, bulk, lump, or 3" x D, \$5.25 per lb of contained B. Packed, carload \$5.40, ton to c.l. \$5.50, less ton \$5.60. Delivered.

Carbortam: (B 1 to 2%). Contract, lump, carload \$320 per ton, f.o.b. Suspension Bridge, N. Y., freight allowed same as high-carbon ferrotitanium.

CALCIUM ALLOYS

Calcium-Manganese-Silicon: (Ca 16-20%, Mn 14-18% and Si 53-59%) Contract, carload, lump, bulk 23c per lb of alloy, carload packed 24.25c, ton lot 26.15c, less ton 27.15c. Delivered. Spot, add 0.25c.

Calcium-Silicon: (Ca 30-33%, Si 60-65%, Fe 1.5-3%). Contract, carload, lump, bulk 24c per lb of alloy, carload packed 25.65c, ton lot 27.95c, less ton 29.45c. Delivered. Spot, add 0.25c.

BRIQUETTED ALLOYS

Chromium Briquets: (Weighing approx 3 1/2 lb each and containing 2 lb of Cr). Contract, carload, bulk 19.60c per lb of briquet, in bags 20.70c; 3000 lb to c.l. pallets 20.80c; 2000 lb to c.l. in bags 21.90c; less than 2000 lb in bags 22.80c. Delivered. Add 0.25c for notching. Spot, add 0.25c.

Ferromanganese Briquets: (Weighing approx 3 lb and containing 2 lb of Mn). Contract, carload, bulk 14.8c per lb of briquet; c.l., packed, bags 16c; 3000 lb to c.l., pallets 16c; 2000 lb to c.l., bags 17.2c; less ton 18.1c. Delivered. Add 0.25c for notching. Spot, add 0.25c.

Silicomanganese Briquets: (Weighing approx 3 1/2 lb and containing 2 lb of Mn and approx 1/2 lb of Si). Contract, c.l. bulk 15.1c per lb of briquet; c.l. packed, bags 16.3c, 3000 lb to c.l., pallets 16.3c; 2000 lb to c.l., bags 17.5c; less ton 18.4c. Delivered. Add 0.25c for notching. Spot, add 0.25c.

Silicon Briquets: (Large size—weighing approx 5 lb and containing 2 lb of Si and small sizes, weighing approx 2 1/2 lb and containing 1 lb of Si). Contract, carload, bulk 8c per lb of briquet; packed, bags 9.2c; 3000 lb to c.l., pallets 9.6c; 2000 lb to c.l., bags 10.8c; less ton 11.7c. Delivered. Spot, add 0.25c.

Molybdc-Oxide Briquets: (Containing 2 1/2 lb of Mo each). \$1.49 per lb of Mo contained, f.o.b. Langeloth, Pa.

Titanium Briquets: Ti 98.27%, \$1 per lb, f.o.b. Niagara Falls, N. Y.

TUNGSTEN ALLOYS

Ferrotungsten: (70-80%). 5000 lb W or more \$2.15 per lb (nominal) of contained W. Delivered.

OTHER FERROALLOYS

Ferrocolumbium: (Cb 50-60%, Si 8% max, C 0.4% max). Ton lots 2" x D, \$4 per lb of contained Cb; less ton lots \$4.05 (nominal). Delivered.

Ferrotantalum Columbium: (Cb 40% approx, Ta 20% approx, and Cb plus Ta 60% min, C 0.30% max). Ton lots 2" x D, \$3.80 per lb of contained Cb plus Ta, delivered; less ton lots \$3.85 (nominal).

SMZ Alloy: (Si 60-65%, Mn 5-7%, Zr 5-7%, Fe 20% approx). Contract, c.l. packed 1/2-in. x 12 M 20.00c per lb of alloy, ton lot 21.15c, less ton 22.40c. Delivered. Spot, add 0.25c.

Graphidox No. 4: (Si 48-52%, Ca 5-7%, Ti 9-11%). C.l. packed, 20c per lb of alloy, ton lot 21.15c; less ton lot 22.4c, f.o.b. Niagara Falls, N. Y.; freight allowed to St. Louis.

V-5 Foundry Alloy: (Cr 38-42%, Si 17-19%, Mn 8-11%). C.l. packed 18.45c per lb of alloy; ton lot 19.95c; less ton lot 21.20c, f.o.b. Niagara Falls, N. Y.; freight allowed to St. Louis.

Simanal: (Approx 20% each Si, Mn, Al; bal Fe). Lump, carload, bulk 19.25c. Packed c.l. 20.25c, 2000 lb to c.l. 21.25c; less than 2000 lb 21.75c per lb of alloy. Delivered.

Ferrophosphorus: (23-25% based on 24% P content with unitage of \$5 for each 1% of P above or below the base). Carload, bulk, f.o.b. sellers' works, Mt. Pleasant, Siglo, Tenn., \$120 per gross ton.

Ferromolybdenum: (55-75%). Per lb of contained Mo, in 200-lb container, f.o.b. Langeloth and Washington, Pa. \$1.76 in all sizes except powdered which is \$1.82.

Technical Molybdc-Oxide: Per lb of contained Mo, in cans, \$1.47; in bags, \$1.46, f.o.b. Langeloth and Washington, Pa.

Wire . . .

Wire Prices, Pages 114 & 115

Manufacturers wire is being turned out in steadily growing volume. Production has been rising slowly for weeks and is now considered about "normal" at some producing points. Expectations are that wire items will move faster from here out with automotive consumption stepping up. The automakers have released substantial tonnage on producers' books, and more orders are reported coming in. This is the off-season for merchant wire, but buying for spring needs will be starting soon.

While New England wiremakers report a slight decline in their bookings for December shipment, they expect a January rebound in orders. Heavy inventories of finished goods made of wire have been lowered, and this should mean increased pressure on the wiremakers.

Imports of low and medium carbon rods are heavier, and more suppliers of finished wire for the building trades are drawing their product from imported rods—bright wire in some cases.

Wickwire Spencer Steel Division, Colorado Fuel & Iron Corp., New York, has started marketing a new extra high strength wire rope under the tradename, Double Gray. It has been field tested on rotary rippers, dozers, shovels, draglines, scrapers, tractors, arch tractors, and every type of machine that imposes heavy loads on rope.

Tin Plate . . .

Tin Plate Prices, Page 114

Under a new policy, American Can Co., New York, will establish separate f.o.b. prices at each of its plants for each type and style of can, replacing average prices applying over broad areas.

The new policy and economy effected by the company's cost processing program will lower can prices, resulting in aggregate savings to customers of over \$9 million, William C. Stolk, president, says.

The company will hold the line on prices until Oct. 1, 1959, except for adjustments that may be necessary to reflect increases in tin plate prices.

Jones & Laughlin Steel Corp., Pittsburgh, has issued a new catalog covering extras and deductions on tin mill products, replacing one in effect since April 30, 1957. Only two minor changes are involved.

Rails, Cars . . .

Track Material Prices, Page 115

The Missouri Pacific Railroad plans a \$15 million modernization program, the largest proposal being \$4,279,000 for work on the new \$100 million electronic classification yard at Kansas City, Mo.

The Louisville & Nashville Railroad has ordered 3000 seventy-ton coal hoppercars from the Bessemer Ala., plant of Pullman-Standard Car Mfg. Co. They will cost an estimated \$28 million.

The order means immediate reopening of the Bessemer plant which has been closed since mid-August. Manufacture of the cars will begin Dec. 1.

Pullman-Standard will recall 3000 to 400 workers early next year at its Pullman Car Works in Chicago. The company has booked an order for 36 doubledeck commuter cars from the Chicago & North Western Railway.

30 "HORSES" with a high LUGGING FACTOR

**The Model VH4
WISCONSIN heavy-duty**

Air-Cooled ENGINE

One of the outstanding characteristics of this engine is its bulldog LUGGING FACTOR... the ability to hang on and keep your equipment going under suddenly increased loads that would most likely stall other engines of comparable piston displacement.

Working against peak loads, this engine will keep on slugging away against an rpm. slowdown from 2800 to 1700 rpm., reaching maximum torque at this low speed.

In terms of power service to the user, this simply means that your Wisconsin Engine is designed to provide dependable load-holding power at low engine speeds. This, in turn, means fewer shutdowns, less wear and tear, more usable power and more versatile performance for your dollar investment.

The high LUGGING FACTOR is one of the basic characteristics that makes Wisconsin Engines worth more... one of the reasons why it pays to specify "WISCONSIN" for your equipment. Write for Bulletins S-196 and S-223.

functional design saved by cold heading

The design of this collar screw would have to be modified to machine it economically. But the design was right for its function. Progressive saved it by cold heading. Only two steps — heading and threading — completed the screw. And we got over $3\frac{1}{2}$ times as many parts from the same amount of metal, because a smaller diameter wire could be used, *without waste*.

Progressive can save you money, too — and give you naturally stronger parts. Write for more case histories in our "Bank Book of Savings in Cold Heading."

MACHINE SCREWS AND NUTS, SEMS FASTENERS,
SLOTTED TAPPING SCREWS AND PHILLIPS HEAD SCREWS

THE PROGRESSIVE MFG. CO.

Division of The Torrington Company

76 Norwood St., Torrington, Connecticut

AMONG OPERATIONS PERFORMED BY PROGRESSIVE are heading and extruding simultaneously; flattening; piercing; drilling; bending; pointing; fluted or diamond knurling; trimming; turning; tenons, shoulders or recesses; struck or sawed slotting; notching.

WANTED

Production machining on a job or long-term basis contracts for precision components, assemblies and complete machine building.

INTRODUCTION TO THE STUDY OF HEAT TREATMENT OF METALLURGICAL PRODUCTS

By Albert Portevin

Fundamental knowledge and essential principles of heat treatment of steel are presented in simple and understandable manner. Research engineers, metallurgical students and steel plant metallurgists engaged in metallurgical investigations and the heat treatment of ferrous and non-ferrous metals will find this book of inestimable value.

STEELMAKING SCRAP PRICE COMPOSITE

Based on No. 1 heavy melting grade at Pittsburgh, Chicago, and eastern Pennsylvania—Compiled by STEEL.

Scrap Index Is Still Slipping

STEEL's composite on the prime grade declines another 34 cents a ton to \$40.33. Mill buying interest sags as the holiday season and inventory-taking period approach

Scrap Prices, Page 126

Philadelphia—Major grades of open hearth scrap have eased further under the influence of light buying and dull prospects for the near future. Mills hold substantial stocks. Little new foreign demand is in sight.

No. 1 heavy melting, No. 1 bundles, and No. 1 busheling are down \$1 to \$36, delivered. No. 2 heavy melting is also down \$1 to \$3, while No. 2 bundles are off 50 cents to \$23, delivered. Other steel grades are unchanged, but easy, with quotations on borings and turnings largely nominal. Prices on heavy breakable cast are easier at \$2, and drop broken machinery \$48-\$49.

New York—Brokers' buying prices on most major grades of scrap are unchanged, but they are largely nominal. An exception is a \$1 reduction in low phos structurals and plates to \$35-\$36. Unstripped motor blocks are off sharply to \$24-\$25. Stainless steel scrap prices also have dropped substantially, brokers buying \$185-\$190 for 18-8 sheets, clips and solids, and \$85-\$90 for 3-8 borings and turnings, reductions of \$5 in each case. On type 410 sheets, clips and solids,

\$55-\$60 is quoted, and on Type 430 material, \$75-\$80, a drop of \$10 a ton in each case. Consumptive demand for stainless appears to have suddenly dried up, with little improvement in immediate prospect.

Chicago—Scrap prices are holding in a market that is more inactive than it has been in many months. Most steel mills are out of the market, and the one or two that do keep a finger in are specifying tonnages so small that no price test is provided. Some brokers point out that price is not of any great concern—the problem is orders. The great need is to get tonnage moving again. Steel-making seems likely to hold close to the present level the rest of this year.

Pittsburgh—The market is lifeless. Even the one steel mill that's been buying small lots in recent weeks now is out of the market. Dealers and brokers are standing pat on prices, which are largely nominal in the absence of representative buying.

Cleveland—So little dealer scrap is being bought by the steel mills, the market is at a virtual standstill despite a 3-point jump in the district steel rate to 73 per cent last

week. Not much buying is anticipated until after the turn of the year. Meanwhile, prices are unchanged, but nominal. Bids on monthend auto lists will point the way for prices the rest of this year.

Youngstown—The market remains listless; steelmakers are not inclined to place additional orders. There have been no recent sales. One blast furnace operator who has been using some machine shop turnings in his furnace burden has increased his ore charge.

Buffalo—With district steel operations sliding, the outlook for scrap is not encouraging. Prices are unchanged, but there is a softer market undertone, and some dealers look for lower prices when the mills begin placing their December tonnage orders.

Scrap is flowing freely; most holders apparently are convinced that prices are not going to advance soon. Small plants are showing less interest in material with year-end inventory taking near.

St. Louis—A little more scrap is being received by dealers here, largely because the mild weather has spurred collections. Supply and demand are pretty much in balance, but there's nothing in the situation to indicate an increase in prices is in prospect.

Cincinnati—Brokers' prices on the principal steelmaking grades have been lowered \$1 a ton. No. 1 heavy melting is now quoted \$37.50-\$38.50. The lower prices are expected to bring out some new orders.

Birmingham—Practically no scrap is moving in this district. Any purchases the rest of this year will probably be limited. Recent small sales of No. 2 steel were at reduced prices; while dealers are resisting the pressure for lower prices, expectations are new purchases will be made below current levels. Consumers' stockpiles are substantial. The Atlanta steel mill continues closed down by a strike. Negotiations are deadlocked.

Houston—December will be one of the slowest months of the year for the local scrap industry. No significant buying is expected. The Houston mill has stretched out deliveries on a November order, and export prospects are not promising. Mexican buyers are not showing any

(Please turn to Page 131)

A 20-ton impact load... 14,400 times a day! Stanscrew Fasteners solve the problem

Fastening the air cylinders on this tube former is a real problem. Each of these 8" bore cylinders delivers a thrust of over 20 tons every time the machine is operated. And since this happens 14,400 times in a normal working day, ordinary fasteners would soon fail under these repeated shock loads. Furthermore, not even the slightest misalignment can be tolerated in this machine.

The Stanscrew fastener specialist was able to quickly answer this demanding problem. His solution was Stanscrew Socket Head Cap Screws, tightened to within 80% of yield strength so they remained in tension. These fasteners, so applied, deliver a clamping force that eliminates the shock feature of this extremely high loading... and provides a 100% factor of safety.

Tough assignments like this are everyday jobs for your Stanscrew fastener specialist. Immediately on call, through your Stanscrew distributor, he can bring to your problem years of specialized experience. And, back of him, is an outstanding staff of engineers who have been solving the fastener problems of American industry since 1872.

Stanscrew's complete line of more than 4,000 different types and sizes will provide economical answers to your fastener requirements. All 4,000 items are always in stock, quickly available.

Call your Stanscrew distributor today for solutions to your fastener problems. He will arrange a prompt meeting with the Stanscrew fastener specialist... who can often suggest ways to save you money by substituting standard fasteners for costly specials.

Copper Use Parallels Sales

Most deliveries have been for immediate consumption. Inventories, cut sharply in the past year, have risen only slightly. Outlook good, prices stable

Nonferrous Metal Prices, Pages 130 & 131

COPPER consumers have stepped up buying because their own sales are better, not from fear of a shortage or runaway price market.

• **The Proof**—A spot survey by STEEL of four major metalworking centers (New York, Pittsburgh, Cleveland, and Chicago) reveals little hedge buying and only slight inventory replenishment. That means copper's current position is even stronger than simple sales figures would indicate. It spells a high level of business for the industry in the weeks ahead.

• **Boom** — Copper "consumption" (shipments of fabricated products by foundries and brass and wire mills) hit 138,916 tons in October, 33,442 tons over September and the best month since March, 1955. At the same time, unfilled orders on fabricators' books rose to a 17-month high and more new orders were received than in any month since January, 1956.

Big users are buying mostly for current consumption. There is some inventory buildup, but that generally reflects beter business.

• **Stocks Slashed**—Even so, inventories are down sharply from a year ago. Some cutbacks took place in the last six months but most came between September, 1957, and May of this year.

A copper distributor in Pittsburgh says the average inventory for its large accounts is no more than a week and that small customers have even less on hand. One indication: A year ago, users were satisfied with deliveries three to four weeks after placing orders. Now they "grudgingly" settle for a week to ten days and press for still faster deliveries.

• **Uncertainty** — A Pennsylvania company has attempted to increase

inventories lately, but business has improved so steadily that every time the company orders copper for both consumption and inventory, it

all finds its way into current usage.

One reason many consumers are worried about inventories: A year ago they found themselves with unwieldy stocks which led many to cut below "safe" working levels. The fourth quarter business upswing has been faster than many estimated and there are still enough foggy factors in the economy to make forecasts sketchy. That puts users in a two-pronged dilemma:

How do you increase stock "safe" levels without tying funds in unneeded inventory?

• **Fair Weather Ahead**—Look continued good business. C northern manufacturer which become a heavy buyer expects maintain its current rate for least six months. Brass mill sales also are expected to show gain. There's more demand for tubular products from plumbing goods distributors. Distribution transformation business is picking up. Demand for magnet wire is on the upswing. Capital equipment sales are weak.

• **Outlook** — Automakers still haven't plunked both feet into the market. When they do, it will add impetus to copper's recovery (cars and trucks account for about 8 per cent of total consumption).

Look for some extra buying for inventory replenishment in the weeks ahead even though metal sales will continue to be for current consumption. The primary price is stable. Custom smelters have dropped their price by 0.5 cent a pound by the middle of last week and were expected to go lower. Significance: Custom smelters have geared their price for overseas sales (where they could command a higher price), but this market collapsed last week. Lower European demand caused London Metal Exchange prices to fall, making it no longer profitable for custom smelters to ship there.

The custom smelter drop is "technical correction" to make the price more competitive with primary. At 29.5 cents a pound custom smelters were still 0.5 cent over primary.

NONFERROUS PRICE RECORD

	Price Nov. 25	Last Change	Previous Price	Oct. Avg	Sept. Avg	Nov., 1957 Avg

REVERE COPPER BUS BAR

used in two new 700-ft. long Udylite Bumper Plating Machines at FORD MOTOR COMPANY

Aids in the production of a new, more durable, corrosion-resistant finish

And to be the world's largest, the two Udylite plating machines are capable of turning out, per machine, 35 racks of bumpers an hour through 10 stages of a 3½ hour plating cycle. The electro-plating installation uses eighty generators, varying from 5,000 to 20,000 amps, which combined, provide enough power to light more than 150,000 bulbs of 100 watts each.

To carry that kind of a load from generator to plating machine, Revere Copper Bus Bar was used because of copper's superior electrical and thermal conductivity. No other commercial metal of the same cross-section approaches electrolytic copper in its ability to carry electricity, while its high thermal conductivity offers the greatest ease of cooling. This means a more compact installation with a resultant saving in space. Also, joints of high electrical conductivity are readily made by soldering, brazing or bolting. For information on Revere Bus Bar, as well as other Revere copper and brass mill products consult the nearest Revere Sales Office. You'll find it listed in the yellow pages of the telephone directory.

REVERE COPPER AND BRASS INCORPORATED

Founded by Paul Revere in 1801

230 Park Avenue, New York 17, N. Y.

Mills: Rome, N.Y.; Baltimore, Md.; Chicago, Clinton and Joliet, Ill.; Detroit, Mich.; Los Angeles and Riverside, Calif.; New Bedford, Mass.; Brooklyn, N.Y.; Newport, Ark.; Ft. Calhoun, Neb. Sales Offices in Principal Cities, Distributors Everywhere.

RACK OF BUMPERS ready for immersion into plating solution at Ford Motor Company's plant at Monroe, Michigan. New process uses copper, white brass, nickel and chromium which results in outstanding durability.

Nonferrous Metals

Cents per pound, carlots except as otherwise noted.

PRIMARY METALS AND ALLOYS

Aluminum: 99.5%, pigs, 24.70; ingots, 26.80, 30,000 lb or more, f.o.b. shipping point. Freight allowed on 500 lb or more.

Aluminum Alloy: No. 13, 28.60; No. 43, 28.40; No. 195, 29.40; No. 214, 30.20; No. 356, 28.60; 30 or 40 lb ingots.

Antimony: R.M.M. brand, 99.5%, 29.00; Lone Star brand, 29.50, f.o.b. Laredo, Tex., in bulk. Foreign brands, 99.5%, 24.50-25.50, New York, duty paid, 10,000 lb or more.

Beryllium: 97% lump or beads, \$71.50 per lb, f.o.b. Cleveland or Reading, Pa.

Beryllium Aluminum: 5% Be, \$74.75 per lb of contained Be, with balance as Al at market price, f.o.b. shipping point.

Beryllium Copper: 3.75-4.25% Be, \$43 per lb of contained Be, with balance as Cu at market price on shipment date, f.o.b. shipping point.

Bismuth: \$2.25 per lb, ton lots.

Cadmium: Sticks and bars, \$1.45 per lb deld.

Cobalt: 97.99%, \$2.00 per lb for 550-lb keg; \$2.02 per lb for 100 lb case; \$2.07 per lb under 100 lb.

Columbium: Powder, \$55-85 per lb, nom.

Copper: Electrolytic, 29.00 deld.; custom smelters, 29.50; lake, 29.00 deld.; fire refined, 28.75 deld.

Germanium: First reduction, \$179.17-197.31 per lb; intrinsic grade, \$197.31-220 per lb, depending on quantity.

Gold: U. S. Treasury, \$35 per oz.

Indium: 99.9%, \$2.25 per troy oz.

Iridium: \$70-80 nom. per troy oz.

Lead: Common, 12.80; chemical, 12.90; cor-rod, 12.90, St. Louis. New York basis, add 0.20.

Lithium: 98 + %, 50-100 lb, cups or ingots, \$12; rod, \$15; shot or wire, \$16. 100-500 lb, cups or ingots, \$10.50; rod, \$14; shot or wire, \$15, f.o.b. Minneapolis.

Magnesium: Pig, 35.25; ingot, 36.00 f.o.b. Velasco, Tex.; 12 in. sticks, 59.00 f.o.b. Madison, Ill.

Magnesium Alloys: AZ91A (diecasting), 40.75 deld.; AZ63A, AZ92A, 9291C (sand casting), 40.75, f.o.b. Velasco, Tex.

Mercury: Open market, spot, New York, \$228-231 per 76-lb flask.

Molybdenum: Unalloyed, turned extrusions, 3.75-5.75 in. round, \$9.60 per lb in lots of 2500 lb or more, f.o.b. Detroit.

Nickel: Electrolytic cathodes, sheets (4 x 4 in. and larger), unpacked, 74.00; 10-lb pigs, unpacked, 73.25; "XX" nickel shot, 79.50; "F" nickel shot for addition to cast iron, 74.50; "F" nickel, 5 lb ingots in kegs for addition to cast iron, 75.50. Prices f.o.b. Port Colborne, Ont., including import duty. New York basis, add 1.01. Nickel oxide sinter at Buffalo, New York, or other established U. S. points of entry, contained nickel, 69.60.

Osmium: \$70-100 per troy oz nom.

Palladium: \$15-17 per troy oz.

Platinum: \$52-55 per troy oz from refineries.

Radium: \$16-21.50 per mg radium content, depending on quantity.

Rhodium: \$118-125 per troy oz.

Ruthenium: \$45-55 per troy oz.

Selenium: \$7.00 per lb, commercial grade.

Silver: Open market, 90.125 per troy oz.

Sodium: 17.00 c.l.; 19.00-19.50 l.c.l.

Tantalum: Rod, \$60 per lb; sheet, \$55 per lb.

Tellurium: \$1.65-1.85 per lb.

Thallium: \$7.50 per lb.

Tin: Straits, N. Y., spot, 99.375; prompt, 99.50.

Titanium: Sponge, 99.3 + % grade A-1, ductile (0.3% Fe max.), \$1.62-1.82; grade A-2 (0.5% Fe max.), \$1.70 per lb.

Tungsten: Powder, 89.8%, carbon reduced, 1000-lb lots, \$3.15 per lb nom., f.o.b. shipping point; less than 1000 lb, add 15.00; 99 + % hydrogen reduced, \$3.30-3.80.

Zinc: Prime Western, 11.50; brass special, 11.75; intermediate, 12.00, East St. Louis, freight allowed over 0.50 per lb. New York basis, add 0.50. High grade, 12.50; special high grade, 12.75 deld. Diecasting alloy ingot No. 3, 14.00; No. 2, 14.25; No. 5, 14.50 deld.

Zirconium: Reactor grade sponge, 100 lb or less, \$7 per lb; 100-500 lb, \$6.50 per lb; over 500 lb, \$6 per lb.

(Note: Chromium, manganese, and silicon metals are listed in ferroalloy section.)

SECONDARY METALS AND ALLOYS

Aluminum Ingot: Piston alloys, 23.875-25.25; No. 12 foundry alloy (No. 2 grade), 21.75-22.00; 5% silicon alloy, 0.60 Cu max, 24.75-25.00; 13 alloy 0.60 Cu max., 24.75-25.00; 195 alloy, 25.25-26.00; 108 alloy, 22.25-22.50. Steel deoxidizing grades, notch bars, granulated or shot: Grade 1, 23.25; grade 2, 22.00; grade 3, 21.00; grade 4, 19.00.

Brass Ingot: Red brass, No. 115, 28.00; tin bronze, No. 225, 37.50; No. 245, 32.25; high-leaded tin bronze, No. 305, 32.25; No. 1 yellow, No. 405, 23.00; manganese bronze, No. 421, 24.75.

Magnesium Alloy Ingot: AZ63A, 37.50; AZ91B, 37.50; AZ91C, 41.25; AZ92A, 37.50.

NONFERROUS PRODUCTS

(Concluded from Page 125)
interest, except for bargain-priced
material.

Los Angeles—Uncertainty rules
in the scrap market here, with ton-
nage moving slowly from dealers'
yards. Auto wrecking activity is at
low ebb. Price buoyancy of cupola
cast is noted, and some sellers are
anticipating higher prices on that
grade.

San Francisco—Dealers' hopes of
an early resumption of scrap ship-

ments to Japan have been dashed
by the statement of a Japanese
trade representative: His country
probably won't buy any scrap from
Pacific Coast sellers for several
months. And he said that when
shipments are resumed, they will
be in smaller quantities.

Seattle — Little change is noted
in the market, but there seems to
be growing resistance to present
price levels on the part of dealers.
They seem convinced that the worst

MODERN OVERHEAD CRANES

Help Wanted

STRUCTURAL ENGINEER

Structural steel designer and estimator for in-
dustrial buildings and miscellaneous steel struc-
tures, as well as steel plate fabrication. Appli-
cant should be graduate engineer, preferably
30-40 years old, with minimum of 5 years ac-
tual structural steel design experience. Perma-
nent employment, paid vacations, group insur-
ance plan. Excellent opportunity. Location
Mid-Continent. Good Schools. Employer is na-
tionally known, well established steel fabricator.
Reply fully, giving resume of experience, edu-
cation, age and salary requirements to Box 709,
STEEL, Penton Building, Cleveland 13, Ohio.

Positions Wanted

SALES ENGINEER

Fifteen years experience, tool steel and stain-
less, New York, Connecticut and Eastern Penn-
sylvania territory preferred. Will furnish resume.
Reply Box 707, STEEL, Penton Bldg., Cleveland
13, Ohio.

FOR SALE

One Link Belt Positive Action Oscillating
Conveyor. Capacity 1 TPH. Trough Width
—36". Overall length—30'. Allis Chalmers
motor, total enclosed, fan cooled. 3 phase,
60 cycles, 220/240 volts, 5 horsepower.
Practically new.

HAVE YOU TRIED THIS EXTRAORDINARY CLEANER?

Oakite Rustripper removes rust and heat scale in the same operation that removes oil. It avoids hydrogen embrittlement, damage to machined surfaces and other disadvantages of acid pickling.

Have you taken the four good steps?

How can cleaning costs be reduced 33% while cleaning quality is being improved?
See pages 7 and 8 of booklet.

What are four easy ways to improve the average rinse tank? *See page 10.*

What causes hydrogen embrittlement during electrocleaning? What is the remedy?
See pages 15 and 16.

Do you need a brass cleaner that gives better protection against tarnishing?

Oakite has a new brass cleaner that provides scientific protection against the oxygen that tarnishes brass and other copper alloys during the application of reverse current.

"It cut our cleaning rejects by more than 90%"

says a manufacturer who found that Oakite Composition No. 95 gave him:

BRIGHTER PLATING—All films removed . . . no residues, no undersurface shadows, no anodic blackening, nothing to impair the brightness of the electroplate.

FEWER REJECTS—Major causes of blistering and peeling eliminated . . . Consistent success in baking for 60 minutes at 300°F.

OAKITE PRODUCTS, INC.

34E Rector Street, New York 6, N. Y.

is over and that improved deal can't be too far off. They are poised to hold out for higher quotations. Yard receipts are up and some yards are practically out of stocks.

Scrapmen Ask Removal Waterborne Freight For

Scrapmen are seeking elimination of a \$1.20 per ton charge recently granted on waterborne shipments of scrap.

The Institute of Scrap Iron & Steel Inc., Washington, has joined in an action before the Interstate Commerce Commission. Summer & Co., Columbus, and Luria Bros. & Co., Philadelphia.

Structural Shapes . . .

Structural Shape Prices, Page 112

Most structural steel fabricating shops are fairly active, but they are operating on a much narrower margin with their backlogs down sharply from those a few months ago. Competition for new work is reflected in lower fabricated prices and a tendency of many shops to reach out beyond their normal territories for work.

New bridgework is holding fairly well in New England. The tonnage required for jobs being estimated is smaller. Except for plate girder project, in Connecticut, most spans are stringer or I-beam construction, which means less shop fabricating.

Distributors . . .

Prices, Page 119

Bookings by steel service centers are holding steady. The rate, which has been maintained for several months, is the highest of this year and about 20 per cent above summer low. Some buying in stock replacement.

Distributors are buying more actively from the mills to round out stocks in preparation for an expected pickup in business early next year. Prospects for the first quarter are bright.

The price situation has stabilized in the Seattle area. But in the rounding territory, price cutting created an unsatisfactory competitive situation.

Pause — in the relaxing, informal atmosphere of the gayly decorated Patio. It's a Cleveland habit to say — "Meet me at the Patio."

 **Coffee Shop**

Service is brisk and decor cheerful in the modern, air-conditioned coffee shop. Enjoy a tasty sandwich or a moderately priced meal.

It's a breeze

TO CUT COSTS, BOOST PRODUCTION
AND QUALITY WITH THE MONARCH
"AIR-GAGE TRACER"

No lathe development in recent years has equaled template controlled turning for substantial cost reduction. Its advantages, when performed the Monarch "Air-Gage Tracer" way, are many. This duplicating method:

- Always outproduces a manually operated machine; in some instances as much as 8 to 10 times.
- Provides automatic sizing, thereby reducing spoiled work to the absolute minimum.
- Imparts a smooth, stepless finish on any combination of cuts, whether turning, facing or boring.

Above is a Monarch Series 62 Preselector Dyna-Shift Lathe with "Air-Gage Tracer" and auto cycle unit. This duplicating means may be factory applied to all Monarch lathes.

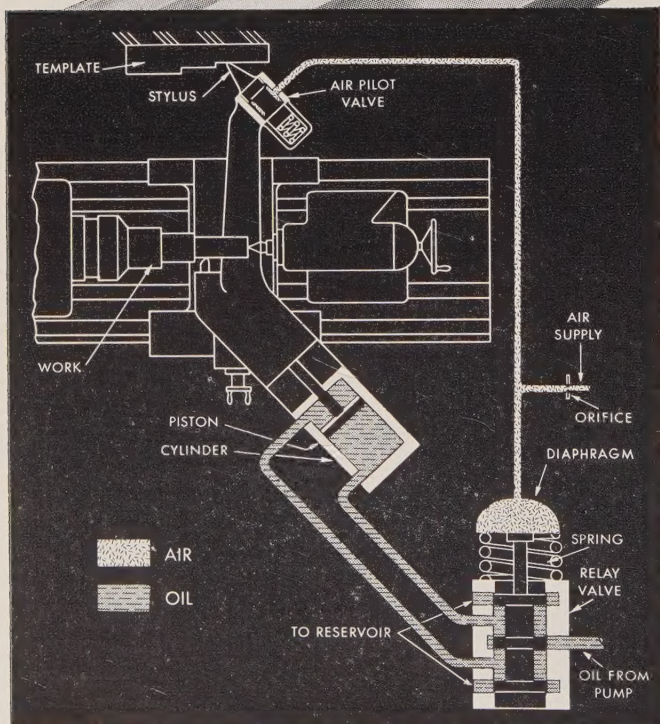

- Often halves amount of stock left for grinding; sometimes eliminates grinding and polishing operations.
- On most work, reproduces accuracy of template within $\pm .001$ ".
- Eliminates the need for expensive form tools and the cost of multiple tool setups.
- Allows a complete setup change in as little as 15 to 20 minutes; tool change in 1 minute.

Write for complete descriptive booklet No. 2608. It contains dozens of typical job examples...**The Monarch Machine Tool Company, Sidney, Ohio.**

Exclusive Features of the "Air-Gage Tracer"

- 1 The only lathe duplicator which utilizes the combination of air-hydraulic control. That's the secret of its superior accuracy.
- 2 The air circuit is an open loop servo system which provides air-gaging and multiplies both force and motion.
- 3 It's the simplest and most trouble-free of all lathe duplicating methods. Tracer head maintenance is never a problem.
- 4 Stylus pressure against template is only 5 to 6 ounces, practically eliminating template wear.
- 5 Either a flat or a round template may be used. Never necessary to use a large, bulky round template so that it can be indexed periodically due to excessive wear at high stylus pressure.
- 6 Available both in a rigid and swiveling type, the latter of which may be used at any setting between 45° and 90°. Universal nature of swiveling type a "must" for top production on many complex facing and boring operations.
- 7 The only lathe duplicator offered optionally with full automatic cycling and potentiometer feed control.

This diagrammatic drawing shows simplicity of "Air-Gage Tracer" operation. Note that design deals with both air and oil in constant motion. Result—super-accuracy piece after piece, job after job.

how to keep aluminum foil from shattering

... at **35 miles**
per hour!

Kaiser Aluminum & Chemical Corp. increased annual production of aluminum foil 50% at its Permanente, California plant through installation of a four high foil mill. This mill reduces aluminum strip in thickness from .026 to .00025 of an inch at speeds up to 3000 fpm.

At 35 miles per hour, excessive strain at any of the several reduction stages would shatter the extremely thin foil. From the original payoff reel through to the final rewind, uniform tension is provided by Reliance V*S Drives.

Reliance engineers designed this drive specifically for this mill, to provide the constant uniform tension which is so important.

This application is typical of the many diversified jobs that Reliance V*S Drives are called upon to perform. There is a Reliance V*S Drive to fit your application.

D-1662

For further details, write Dept. 412A, or call!

Main control room—Where Reliance equipment provides more than 2,900 hp. to drive this mill.

How missile-age bearing production can cut your bearing costs

HERE'S the inside of our revolutionary new bearing plant in Bucyrus, Ohio that can turn out a record-shattering 30 million bearings a year without a hand touching them. By standardizing on bearings, made by these ultra-modern methods, the automobile industry has helped keep these fantastic machines going, helping us make bearings at lower cost so we can pass the manufacturing savings on to our customers.

Why not cut your bearing costs by switching to cost-cutting Timken® bearings made by the ultimate in mechanization? Our engineers will be glad to help you adapt them to your machines. If you've already made the switch as the farm implement and conveyor manufacturers have—use more *Timken* bearings and keep on saving. The chart at right shows the bearing sizes and numbers made in Bucyrus, to use for savings. The Timken Roller Bearing Company, Canton 6, Ohio. Cable address: "TIMROSCO".
